**Abstract.** In this paper we prove that  $CS[S(B_n)]$  and  $CS[S(C_n)]$  are Eulerian lattices under the set inclusion relation but they are neither simplicial nor dual simplicial.

**2010 Mathematics Subject Classifications:** 06A06, 06A07, 06B10

**Key Words and Phrases:** Lattices, Convex Sublattices, Dual Simplicial Lattices, Eulerian Lattices

### 1. Introduction

The study of lattice of convex sublattices of a lattice was started by K. M. Koh[3], in the year 1972. He investigated the internal structure of a lattice  $L$ , in relation to  $CS(L)$ , like so many other authors for various algebraic structures such as groups, Boolean algebras, directed graphs and so on.

In [3], several basic properties of  $CS(L)$  have been studied where one of the results proved is “If  $L$  is complemented then  $CS(L)$  is complemented”. Also, the connection of the structure of  $CS(L)$  with those of the ideal lattice  $I(L)$  and the dual ideal lattice  $D(L)$  are examined by K. M. Koh. He also derived the best lower bound and upper bound for the cardinality of  $CS(L)$ , where  $L$  is finite. In a subsequent paper[1], Chen C. K., Koh K. M., proved that

$$CS(L \times K) \cong [(CS(L) - \{\emptyset\}) \times (CS(K) - \{\emptyset\})] \cup \{\emptyset\}.$$

Finally they proved that when  $L$  is a finite lattice and  $CS(L) \cong CS(M)$  and if  $L$  is relatively complemented (complemented) then  $M$  is relatively complemented (complemented). This is true for Eulerian lattices, since an Eulerian lattice is relatively complemented. These results gave motivation for us to look into the connection between  $L$  and  $CS(L)$  for Eulerian lattices which are a class of lattices not defined by identities. A construction of a new Eulerian lattice  $S(B_n)$  from a Boolean algebra  $B_n$  of rank  $n$  is found in the thesis

of V. K. Santhi in 1992[11]. In 2012, Subbarayan had proved in his paper that the lattice of convex sublattices of a boolean algebra  $B_n$ , of rank  $n$ ,  $CS(B_n)$  with respect to the set inclusion relation is a dual simplicial Eulerian lattice.

In this paper, we are going to look at the similar structure of  $CS(S(B_n))$ .

$S(B_4)$  is shown in the following diagram.

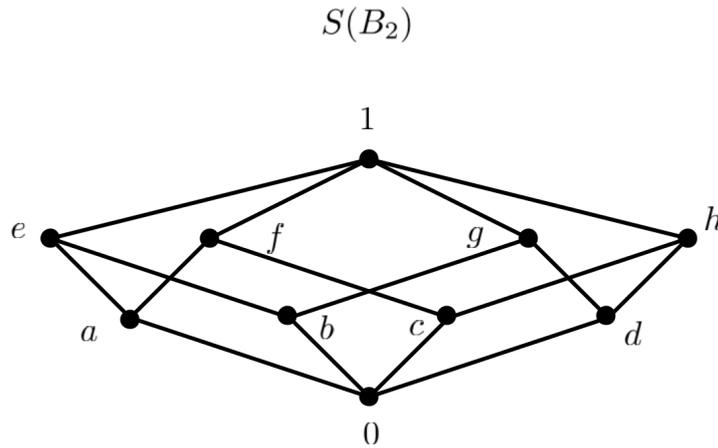

Figure 1:  $S(B_2)$

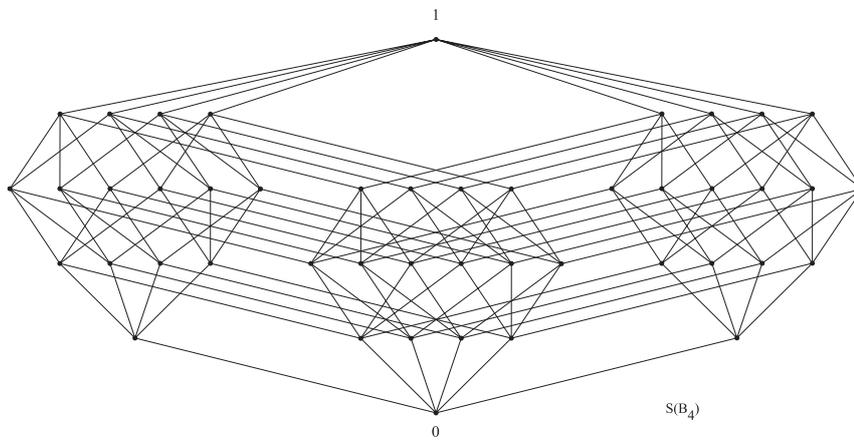

Figure 2:  $S(B_4)$

## 2. Preliminaries

Throughout this section  $CS(L)$  is equipped with the partial order of set inclusion relation.

**Definition 2.1.** A finite graded poset  $P$  is said to be Eulerian if its Möbius function assumes the value  $\mu(x, y) = (-1)^{l(x,y)}$  for all  $x \leq y$  in  $P$ , where  $l(x, y) = \rho(y) - \rho(x)$  and  $\rho$  is the rank function on  $P$ .

An equivalent definition for an Eulerian poset is as follows:

**Lemma 2.2.** [5] A finite graded poset  $P$  is Eulerian if and only if all intervals  $[x, y]$  of length  $l \geq 1$  in  $P$  contain an equal number of elements of odd and even rank.

**Example 2.3.** Every Boolean algebra of rank  $n$  is Eulerian and the lattice  $C_4$  of Figure 2 is an example for a non-modular Eulerian lattice.

Also, every  $C_n$  is Eulerian for  $n \geq 4$ .

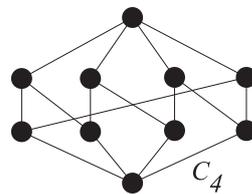

Figure 3: Non-modular Eulerian lattice

**Lemma 2.4.** [12] If  $L_1$  and  $L_2$  are two Eulerian lattices then  $L_1 \times L_2$  is also Eulerian.

We note that any interval of an Eulerian lattice is Eulerian and an Eulerian lattice cannot contain a three element chain as an interval.

**Definition 2.5.** A poset  $P$  is called Simplicial if for all  $t \neq 1 \in P$ ,  $[0, t]$  is a Boolean algebra and  $P$  is called Dual Simplicial if for all  $t \neq 0 \in P$ ,  $[t, 1]$  is a Boolean algebra.

**Lemma 2.6.** [1] Let  $L$  and  $K$  be any two lattices. Then

$$CS(L \times K) \cong [(CS(L) - \{\emptyset\}) \times (CS(K) - \{\emptyset\})] \cup \{\emptyset\}.$$

**Lemma 2.7.** [14] Let  $B_n$  be a Boolean lattice of rank  $n$ . Then  $CS(B_n)$  is a dual simplicial Eulerian lattice.

### 3. Convex sublattices of $S(B_n)$

**Theorem 3.1.** The lattice of convex sublattices of  $S(B_n)$ ,  $CS(S(B_n))$  with respect to the set inclusion relation is an Eulerian lattice.

*Proof.* It is clear that the rank of  $CS(S(B_n))$  is  $n + 2$ .

We are going to prove that  $CS(S(B_n))$  is Eulerian.

That is, to prove that this interval  $[\emptyset, B_n]$  has the same number of elements of odd and even rank.

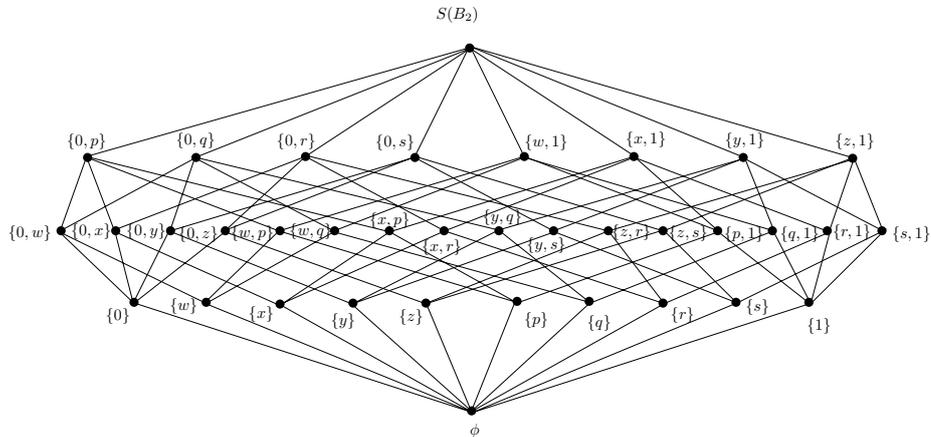

Figure 4:  $CS[S(B_2)]$

Let  $A_i$  be the number of elements of rank  $i$  in  $CS(S(B_n))$ .

$$\begin{aligned}
 A_1 &= \text{The number of singleton subsets of } CS[S(B_n)] \\
 &= 2 + n + 2 + 2n + \binom{n}{2} + 2 \binom{n}{2} + \binom{n}{3} + 2 \binom{n}{3} + \binom{n}{4} \\
 &\quad + \dots + 2 \binom{n}{n-2} + \binom{n}{n-1} + 2 \binom{n}{n-1} \\
 &= 2 + \binom{n}{1} + 2 \binom{n}{0} + 2 \binom{n}{1} + \binom{n}{2} + 2 \binom{n}{2} + \binom{n}{3} \\
 &\quad + 2 \binom{n}{3} + \binom{n}{4} + \dots + 2 \binom{n}{n-2} + \binom{n}{n-1} + 2 \binom{n}{n-1} \quad (1)
 \end{aligned}$$

$$\begin{aligned}
 A_2 &= \text{The number of rank 2 elements in } CS(S(B_n)) \\
 &= \text{The number of edges in } S(B_n) \\
 &= \text{number of edges containing } 0 + \text{number of edges containing the atoms} \\
 &\quad + \text{number of edges from the rank 2 elements} \\
 &\quad + \dots + \text{number of edges containing the coatoms of } S(B_n).
 \end{aligned}$$

$$\text{Number of edges containing } 0 \qquad \qquad \qquad = n + 2 \qquad (2)$$

Number of edges containing an extreme atom  $=n$

There are 2 such extreme atoms. Therefore total number of such edges  $= 2 \binom{n}{1}$ .

From an atom of a middle copy, the number of edges  $= n - 1 + 2 = n + 1$ .

There are  $n$  such atoms.

Therefore total number of such type of edges  $= n(n + 1)$ .

Totally from the atoms, the number of edges is equal to

$$2 \binom{n}{1} + \binom{n}{1} (n + 1). \tag{3}$$

Number of edges from a rank 2 element in an extreme copy  $= n - 1$ .

There are  $2n$  such elements.

Therefore the number of edges from these elements  $= 2 \binom{n}{1} (n - 1)$ .

The number of edges from the rank 2 elements in the middle copy  $= \binom{n}{2} \times (n - 2 + 2) = \binom{n}{2} \times n$ .

The total number of edges from rank 2 elements is

$$2 \binom{n}{1} (n - 1) + \binom{n}{2} \times n. \tag{4}$$

The number of edges from the rank 3 elements in the middle copy is  $n - 3 + 2 = n - 1$ .

There are  $\binom{n}{3}$  such elements.

Therefore the number of edges from the rank 3 elements in the middle copy  $= \binom{n}{3} (n - 1)$ .

The number of edges from a rank 3 element in an extreme copy is  $n - 2$ .

There are  $2 \binom{n}{2}$  such elements.

Therefore number of edges from rank 3 elements in the extreme copies  $= 2 \binom{n}{2} (n - 2)$ .

Therefore total number of edges from rank 3 elements of  $CS(S(B_n))$  is

$$2 \binom{n}{2} (n - 2) + \binom{n}{3} (n - 1) \tag{5}$$

Proceeding like this we get the number of edges from the co-atoms  $= 2n = 2 \binom{n}{n-1} (n - \overline{n-1})$

From (2), (3), (4) and (5), the total number of edges in  $S(B_n)$  is

$$\begin{aligned}
 A_2 &= n + 2 + 2 \binom{n}{1} + \binom{n}{1} (n + 1) + 2 \binom{n}{1} (n - 1) \\
 &\quad + \binom{n}{2} n + \binom{n}{3} (n - 1) + 2 \binom{n}{2} (n - 2) \\
 &\quad + \dots + 2 \binom{n}{n-1} (n - \overline{n-1}) \\
 &= 2 + \binom{n}{1} + 2 \binom{n}{1} + \binom{n}{1} (n + 2 - 1) \\
 &\quad + 2 \binom{n}{1} (n - 1) + \binom{n}{2} (n + 2 - 2) + 2 \binom{n}{2} (n - 2) \\
 &\quad + \binom{n}{3} (n + 2 - 3) + \dots + 2 \binom{n}{n-1} (n - \overline{n-1}) \quad (6)
 \end{aligned}$$

$A_3 =$  The number of 4-element sublattices.

$$\text{The number of 4-element sublattices from } 0 = 2 \binom{n}{1} + \binom{n}{2}. \quad (7)$$

Fix an atom  $a \in S(B_n)$ .

If  $a$  is the bottom element of the left copy of  $S(B_n)$  then  $[a, 1] \simeq B_n$ .

Therefore the number of  $B_2$ 's containing  $a$  is  $\binom{n}{2}$ .

Similarly the number of  $B_2$ 's containing the bottom element of the right copy is  $\binom{n}{2}$ .

If  $a$  is in the middle copy of  $S(B_n)$  then  $[a, 1] \simeq S(B_{n-1})$ .

In this  $S(B_{n-1})$ , we have two extreme copies and a middle copy.

Therefore the number of  $B_2$ 's containing  $a$  is  $2(n-1) + \binom{n-1}{2}$ .

There are  $\binom{n}{1}$  such atoms. Therefore the total number of  $B_2$ 's containing all the atoms in the middle copy is

$$\binom{n}{1} \left[ 2(n-1) + \binom{n-1}{2} \right].$$

Therefore the number of  $B_2$ 's containing all the atoms of  $S(B_n)$  is

$$2 \binom{n}{2} + \binom{n}{1} \left[ 2(n-1) + \binom{n-1}{2} \right]. \quad (8)$$

Fix a rank 2 element  $x$  in  $S(B_n)$ . If  $x$  is in the left copy of  $S(B_n)$ , we have,

$$[x, 1] \simeq B_{n-1}.$$

A  $B_2$  containing  $x$  emanates from a rank 2 element in that  $B_{n-1}$ .

There are  $\binom{n-1}{2}$  rank 2 elements in  $B_{n-1}$ .

Therefore the number of  $B_2$ 's containing  $x$  in the left copy is  $\binom{n-1}{2}$ .

There are  $n$  such rank 2 elements  $x$  in the left copy.

The number of  $B_2$ 's in the left copy containing all the rank 2 elements is  $\binom{n-1}{2}n$ .

Similarly the same number in the right copy.

If  $x$  is in the middle copy of  $S(B_n)$ , then

$$[x, 1] \simeq S(B_{n-2}).$$

The number of  $B_2$ 's containing  $x$  in the left copy of that  $S(B_{n-2})$  is  $n-2$ . Similarly the number in the right copy is  $n-2$ .

Come to the middle copy  $\simeq B_{n-2}$ . Therefore the number of  $B_2$ 's containing  $x$  in the middle copy of that  $S(B_{n-2})$  is  $\binom{n-2}{2}$ .

Therefore the total number of  $B_2$ 's containing  $x$  in this  $S(B_{n-2})$  is  $2(n-2) + \binom{n-2}{2}$ .

There are  $\binom{n}{2}$  such  $x$ 's. Therefore the total number of  $B_2$ 's containing all the rank 2 elements in the middle copy is

$$\binom{n}{2} \left[ 2(n-2) + \binom{n-2}{2} \right] + 2 \binom{n}{1} \binom{n-1}{2}. \tag{9}$$

Fix a rank 3 element  $x$  of  $S(B_n)$ . If  $x$  is in the left copy of  $S(B_n)$ , then

$$[x, 1] \simeq B_{n-2}.$$

A  $B_2$  containing  $x$  emanates from a rank 4 element in that  $B_{n-2}$ .

Therefore the number of  $B_2$ 's containing  $x$  in the left copy of  $S(B_n)$  is  $\binom{n}{2} \binom{n-2}{2}$ .

Similarly to the right copy.

Come to the middle copy. If  $x$  is in the middle copy of  $S(B_n)$ , then

$$\therefore [x, 1] \simeq S(B_{n-3}).$$

In this  $S(B_{n-3})$  we have to calculate the number of  $B_2$ 's containing  $x$ .

The number of  $B_2$ 's containing  $x$  in the left copy of  $S(B_{n-3})$  is  $n-3$ .

Similarly the number in the right copy of this  $S(B_{n-3})$  is  $n-3$ .

The number of  $B_2$ 's containing  $x$  in the middle copy of this  $S(B_{n-3})$  is  $\binom{n-3}{2}$ .

Therefore, the number of  $B_2$ 's in this  $S(B_{n-2})$  containing  $x$  is  $2(n-3) + \binom{n-3}{2}$ .

There are  $\binom{n}{3}$  such rank 3 elements in  $x$  in the middle copy of  $S(B_n)$ .

Therefore the total number of  $B_2$ 's containing  $x$  in  $S(B_n)$  is

$$\binom{n}{3} \left[ 2(n-3) + \binom{n-3}{2} \right].$$

Therefore the total number of  $B_2$ 's containing all the rank 3 elements is

$$2 \binom{n}{2} \binom{n-2}{2} + \binom{n}{3} \left[ 2(n-3) + \binom{n-3}{2} \right] \tag{10}$$

Continuing like this, we get, the number of  $B_2$ 's containing all the rank  $(n-2)$  elements in  $S(B_n)$  is

$$2 \binom{n}{n-3} \times 3 + \binom{n}{n-2} \times 4. \tag{11}$$

The number of  $B_2$ 's containing rank  $(n-1)$  elements is

$$2 \binom{n}{n-2} + \binom{n}{n-1}. \tag{12}$$

From (7), (8), (9), (10), (11) and (12) we get,

$$\begin{aligned} A_3 = & 2 \binom{n}{1} + \binom{n}{2} + 2 \binom{n}{2} + \binom{n}{1} \left[ 2(n-1) + \binom{n-1}{2} \right] \\ & + \binom{n}{2} \left[ 2(n-2) + \binom{n-2}{2} \right] + 2 \binom{n}{1} \binom{n-1}{2} \\ & + 2 \binom{n}{2} \binom{n-2}{2} + \binom{n}{3} \left[ 2(n-3) + \binom{n-3}{2} \right] + \dots \\ & + 2 \binom{n}{n-3} \times 3 + \binom{n}{n-2} \times 4 + 2 \binom{n}{n-2} + \binom{n}{n-1}. \end{aligned}$$

That is,

$$\begin{aligned} A_3 = & 2 \binom{n}{1} + \binom{n}{2} + 2 \binom{n}{2} + 2 \binom{n}{1} \binom{n-1}{1} + \binom{n}{1} \binom{n-1}{2} \\ & + 2 \binom{n}{1} \binom{n-1}{2} + 2 \binom{n}{2} \binom{n-2}{1} + \binom{n}{2} \binom{n-2}{2} \\ & + 2 \binom{n}{2} \binom{n-2}{2} + 2 \binom{n}{3} \binom{n-3}{1} + \binom{n}{3} \binom{n-3}{2} \\ & + \dots + 2 \binom{n}{n-2} + \binom{n}{n-1}. \tag{13} \end{aligned}$$

Similar argument will give,  
 $A_4$  = the number of rank 3 sublattices.

$$\begin{aligned}
 A_4 = & \left[ 2 \binom{n}{2} + \binom{n}{3} \right] + 2 \binom{n}{3} + \binom{n}{1} \left[ 2 \binom{n-1}{2} + \binom{n-1}{3} \right] \\
 & + \binom{n}{2} \left[ 2 \binom{n-2}{2} + \binom{n-2}{3} \right] + 2 \binom{n}{2} \binom{n-2}{3} \\
 & + 2 \binom{n}{1} \binom{n-1}{3} + \binom{n}{3} \left[ 2 \binom{n-3}{2} + \binom{n-3}{3} \right] \\
 & + \dots + 2 \binom{n}{n-3} + \binom{n}{n-2}.
 \end{aligned}$$

That is,

$$\begin{aligned}
 A_4 = & 2 \binom{n}{2} + \binom{n}{3} + 2 \binom{n}{2} + 2 \binom{n}{1} \binom{n-1}{2} + \binom{n}{1} \binom{n-1}{3} \\
 & + 2 \binom{n}{1} \binom{n-1}{3} + 2 \binom{n}{2} \binom{n-2}{2} + \binom{n}{2} \binom{n-2}{3} \\
 & + 2 \binom{n}{2} \binom{n-2}{3} + 2 \binom{n}{3} \binom{n-3}{2} + \binom{n}{3} \binom{n-3}{3} \\
 & + \dots + 2 \binom{n}{n-3} + \binom{n}{n-2}. \tag{14}
 \end{aligned}$$

$A_5$  = the number of rank 4 sublattices.

$$\begin{aligned}
 A_5 = & 2 \binom{n}{3} + \binom{n}{4} + 2 \binom{n}{4} + 2 \binom{n}{1} \binom{n-1}{3} + \binom{n}{1} \binom{n-1}{4} \\
 & + 2 \binom{n}{1} \binom{n-1}{4} + 2 \binom{n}{2} \binom{n-2}{3} + \binom{n}{2} \binom{n-2}{4} \\
 & + 2 \binom{n}{2} \binom{n-2}{4} + 2 \binom{n}{3} \binom{n-3}{3} + \binom{n}{3} \binom{n-3}{4} \\
 & + \dots + 2 \binom{n}{n-4} + \binom{n}{n-3} \tag{15}
 \end{aligned}$$

and so on.

Finally, we get

$$A_n = 2 \binom{n}{n-2} + \binom{n}{n-1} + 2 \binom{n}{n-1} + 2 \binom{n}{1} \binom{n-1}{n-2}. \tag{16}$$

$$A_{n+1} = 2 \binom{n}{n-1} + (n+2). \tag{17}$$

Case (i): Suppose  $n$  is even.

$$\begin{aligned}
& A_1 - A_2 + A_3 - A_4 + \dots + A_{n+1} \\
&= \binom{n}{0} [2 + 2 - 2] + \binom{n}{1} \left[ 1 + 2 - 1 - 2 - n - 2 + 1 - 2 \binom{n-1}{1} \right] + 2 \\
&\quad + 2 \binom{n-1}{1} + \binom{n-1}{2} + 2 \binom{n-1}{2} - 2 \binom{n-1}{2} - \binom{n-1}{3} \\
&\quad - 2 \binom{n-1}{3} + 2 \binom{n-1}{3} + \binom{n-1}{4} + 2 \binom{n-1}{4} + \dots \\
&\quad + \binom{n-1}{n-1} \left] + \binom{n}{2} \left[ 1 + 2 - n - 2 + 2 \binom{n-2}{1} + 1 + 2 + 2 \binom{n-2}{1} \right] \\
&\quad + \binom{n-2}{2} + 2 \binom{n-2}{2} - 2 - 2 \binom{n-2}{2} - \binom{n-2}{3} - 2 \binom{n-2}{3} \\
&\quad + 2 \binom{n-2}{3} + \binom{n-2}{4} + 2 \binom{n-2}{4} + \dots + \binom{n-2}{n-2} \left] + \binom{n}{3} \left[ 1 \right. \\
&\quad \left. + 2 - n - 2 + 3 + 2 \binom{n-3}{1} + \binom{n-3}{2} - 1 - 2 - 2 \binom{n-3}{2} + 2 \right. \\
&\quad \left. - \binom{n-3}{3} + 1 + 2 \binom{n-3}{3} + \binom{n-3}{n-3} \right] + \dots - \binom{n}{n-1} \left[ 1 + 2 - 2 \right. \\
&\quad \left. - 1 + 1 - 1 - 2 + 2 - \binom{n-\overline{n-1}}{n-\overline{n-1}} \right] + \binom{n}{n} [2] \\
&= 2[2^{n-1}] - \left[ \binom{n}{1} + \binom{n}{2} + \dots + \binom{n}{n-1} \right] \\
&= 2^n - [2^n - 2] \\
&= 2.
\end{aligned}$$

Case (ii): Suppose  $n$  is odd.

$$\begin{aligned}
& A_1 - A_2 + A_3 - A_4 + \dots - A_{n+1} \\
&= \binom{n}{0} [2 + 2 - 2] + \binom{n}{1} \left[ 1 + 2 - 1 - 2 - n - 2 + 1 - 2 \binom{n-1}{1} \right] + 2 \\
&\quad + 2 \binom{n-1}{1} + \binom{n-1}{2} + 2 \binom{n-1}{2} - 2 \binom{n-1}{2} - \binom{n-1}{3} \\
&\quad - 2 \binom{n-1}{3} + 2 \binom{n-1}{3} + \binom{n-1}{4} + 2 \binom{n-1}{4} + \dots \\
&\quad + \binom{n-1}{n-1} \left] + \binom{n}{2} \left[ 1 + 2 - n - 2 + 2 \binom{n-2}{1} + 1 + 2 + 2 \binom{n-2}{1} \right] \\
&\quad + \binom{n-2}{2} + 2 \binom{n-2}{2} - 2 - 2 \binom{n-2}{2} - \binom{n-2}{3} - 2 \binom{n-2}{3} \\
&\quad + 2 \binom{n-2}{3} + \binom{n-2}{4} + 2 \binom{n-2}{4} + \dots + \binom{n-2}{n-2} \left] + \binom{n}{3} \left[ 1 \right. \\
&\quad \left. + 2 - n - 2 + 3 + 2 \binom{n-3}{1} + \binom{n-3}{2} - 1 - 2 - 2 \binom{n-3}{2} + 2 \right. \\
&\quad \left. - \binom{n-3}{3} + 1 + 2 \binom{n-3}{3} + \binom{n-3}{n-3} \right] + \dots - \binom{n}{n-1} \left[ 1 + 2 - 2 \right. \\
&\quad \left. - 1 + 1 - 1 - 2 + 2 - \binom{n-\overline{n-1}}{n-\overline{n-1}} \right] + \binom{n}{n} [2] \\
&= 2[2^{n-1}] - \left[ \binom{n}{1} + \binom{n}{2} + \dots + \binom{n}{n-1} \right] \\
&= 2^n - [2^n - 2] \\
&= 2.
\end{aligned}$$

$$\begin{aligned}
 &+ 2 \binom{n-2}{3} + \binom{n-2}{4} + 2 \binom{n-2}{4} + \dots + \binom{n-2}{n-2} \Big] + \binom{n}{3} \Big[ 1 \\
 &+ 2 - n - 2 + 3 + 2 \binom{n-3}{1} + \binom{n-3}{2} - 1 - 2 - 2 \binom{n-3}{2} + 2 \\
 &- \binom{n-3}{3} + 1 + 2 \binom{n-3}{3} + \binom{n-3}{n-3} \Big] + \dots - \binom{n}{n-1} \Big[ 1 + 2 - 2 \\
 &- 1 + 1 - 1 - 2 + 2 - \binom{n-\overline{n-1}}{n-\overline{n-1}} \Big] - \binom{n}{n} [2] \\
 = &2 \Big[ \binom{n}{0} + \binom{n}{2} + \dots + \binom{n}{n-1} \Big] - \Big[ \binom{n}{1} + \binom{n}{2} + \dots \\
 &+ \binom{n}{n-1} \Big] \\
 = &2[2^{n-1} - 1] - [2^n - 2] \\
 = &0.
 \end{aligned}$$

Hence the interval  $[\emptyset, S(B_n)]$  has the same number of elements of odd and even rank.

Though in the above theorem we have proved that  $CS(S(B_n))$  is Eulerian, it is not dual simplicial. For example,  $CS(S(B_2))$  itself is not dual simplicial. For a general non-Boolean Eulerian lattice it seems difficult to decide the structure, but for  $C_n$  we give the proof in the next section.

#### 4. Convex Sublattices of $S(C_n)$

**Theorem 4.1.** *The lattice of convex sublattices of  $S(C_n)$  with respect to the set inclusion relation is an Eulerian lattice.*

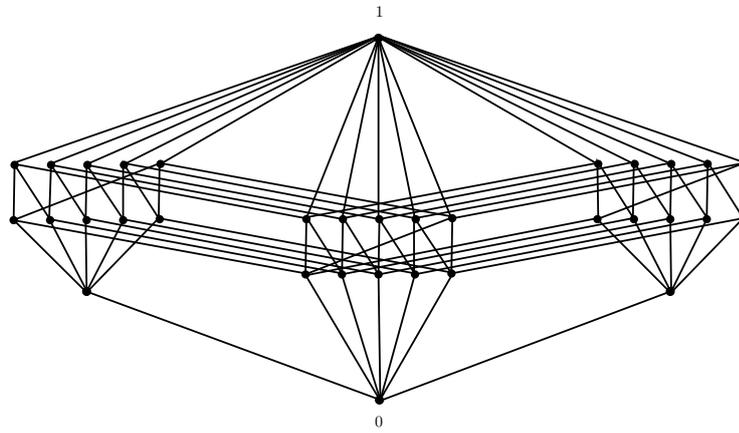

*Proof.* We are going to prove that  $CS(S(C_n))$  is Eulerian. That is to prove the interval  $[5, S(C_n)]$  has the same number of elements of odd and even rank.

Let  $A_i$  be the number of elements of rank  $i$  in  $CS(S(C_n))$ .

$$\begin{aligned}
 A_1 &= \text{The number of singleton subsets of } CS(S(C_n)) \\
 &= 1 + n + 2 + 3n + 2n + 1 \\
 &= 6n + 4.
 \end{aligned} \tag{18}$$

$$\begin{aligned}
 A_2 &= \text{The number of rank 2 elements in } CS(S(C_n)) \\
 &= 2 + n + 2n + 4n + 4n + 2n + 2n \\
 &= 15n + 2.
 \end{aligned} \tag{19}$$

$$A_3 = \text{The number of 4-element sublattices}$$

Figure 5:  $S(C_5)$ 

$$\begin{aligned}
 &= 2n + n + 2n + 2n + 2n + 2n + n \\
 &= 12n.
 \end{aligned} \tag{20}$$

$$\begin{aligned}
 A_4 &= \text{The number of rank 3 sublattices} \\
 &= 2n + n + 2 \\
 &= 3n + 2.
 \end{aligned} \tag{21}$$

Therefore,

$$A_1 - A_2 + A_3 - A_4 = 6n + 4 - 15n - 2 + 12n - 3n - 2 = 0.$$

Hence the interval  $[5, S(C_n)]$  has a same number of elements of odd and even rank.
