#### Abstract

Let $G$ be a (simple) connected graph with vertex and edge sets $V(G)$ and $E(G)$, respectively. A set $S \subseteq V(G)$ is a hop dominating set of $G$ if for each $v \in V(G) \backslash S$, there exists $w \in S$ such that $d_{G}(v, w)=2$. The minimum cardinality of a hop dominating set of $G$, denoted by $\gamma_{h}(G)$, is called the hop domination number of $G$. In this paper we revisit the concept of hop domination, relate it with other domination concepts, and investigate it in graphs resulting from some binary operations.

2010 Mathematics Subject Classifications: 05C69
Key Words and Phrases: Domination, hop domination, join, corona, and lexicographic product

## 1. Introduction

Domination in graph and several variations of the concept have been widely studied by many researchers. The two books by Haynes et al. [3, 4] give an excellent treatment of the standard domination concept and some of its variants.

Recently, Natarajan and Ayyaswamy [6] introduced and studied the concept of hop domination in a graph. In another study, Ayyaswamy et al. [2] investigated the same concept and gave bounds of the hop domination number of some graphs. Henning and Rad [5] also studied the concept and answered a question posed by Ayyaswamy and Natarajan in [6]. They presented probabilistic upper bounds for the hop domination number and showed that the decision problems for the 2 -step dominating set and hop dominating set problems are NP-complete for planar bipartite graphs and planar chordal graphs. Pabilona and Rara [7] considered the variant called connected hop domination and studied it in graphs under some binary operations.

[^0]Let $G=(V(G), E(G))$ be a simple graph. The open neighbourhood of a vertex $v$ of $G$ is the set $N_{G}(v)=\{u \in V(G): u v \in E(G)\}$ and its closed neighbourhood is the set $N_{G}[v]=N_{G}(v) \cup\{v\}$. The degree of $v$, denoted by $\operatorname{deg}_{G}(v)$, is equal to $\left|N_{G}(v)\right|$ and the maximum degree of $G$, denoted by $\Delta(G)$, is equal to $\max \left\{d e g_{G}(v): v \in V(G)\right\}$. The open hop neighbourhood of vertex $v$ is the set $N_{G}(v, 2)=\left\{w \in V(G): d_{G}(v, w)=2\right\}$, where $d_{G}(v, w)$ denotes the distance between $v$ and $w$ (the length of a shortest path joining $v$ and $w)$. The open neighbourhood of a subset $S$ of $V(G)$ is the set $N_{G}(S)=\cup_{v \in S} N_{G}(v)$ and its closed neighbourhood is the set $N_{G}[S]=N_{G}(S) \cup S$.

A set $S \subseteq V(G)$ is a dominating set (resp. total dominating set) of $G$ if $N_{G}[S]=V(G)$ (resp. $N_{G}(S)=V(G)$ ). The smallest cardinality of a dominating (resp. total dominating) set of $G$, denoted by $\gamma(G)$ (resp. $\gamma_{t}(G)$ ), is called the domination number (resp. total domination number) of $G$. A dominating (resp. total dominating) set $S$ of $G$ with $|S|=$ $\gamma(G)$ (resp. $|S|=\gamma_{t}(G)$ ), is called a $\gamma$-set (resp. $\gamma_{t}$-set) of $G$. It should be noted that only graphs without isolated vertices admit total dominating sets.

A set $S \subseteq V(G)$ is a hop dominating set (total hop dominating set) of $G$ if for each $x \in V(G) \backslash S$ (resp. $x \in V(G)$ ), there exists $z \in S$ such that $d_{G}(x, z)=2$. The smallest cardinality of a hop dominating (total hop dominating) set of $G$, denoted by $\gamma_{h}(G)$ (resp. $\gamma_{t h}(G)$ ), is called the hop domination number (total hop domination number) of $G$. A hop dominating (total hop dominating) set $S$ of $G$ with $|S|=\gamma_{h}(G)\left(\right.$ resp. $\left.|S|=\gamma_{t h}(G)\right)$ is called a $\gamma_{h}$-set (resp. $\gamma_{t h}$-set) of $G$.

A set $S \subseteq V(G)$ is a $(1,2)^{*}$-dominating set (resp. (1,2)*-total dominating set) of $G$ if it is a dominating (resp. total dominating) set of $G$ and for each $x \in V(G) \backslash S$, there exists $z \in S$ such that $d_{G}(x, z)=2$. The smallest cardinality of a $(1,2)^{*}$-dominating (resp. $(1,2)^{*}$-total dominating) set of $G$, denoted by $\gamma_{1,2}^{*}(G)\left(\right.$ resp. $\left.\gamma_{1,2}^{* t}(G)\right)$, is called the $(1,2)^{*}$ domination number (resp. $(1,2)^{*}$-total domination number) of $G$. A $(1,2)^{*}$-dominating (resp. $(1,2)^{*}$ - total dominating) set $S$ with $|S|=\gamma_{1,2}^{*}(G)$ (resp. $|S|=\gamma_{1,2}^{* t}(G)$ ) is called a $\gamma_{1,2}^{*}$-set (resp. $\gamma_{1,2}^{* t}$-set) of $G$. Clearly, $S \subseteq V(G)$ is a $(1,2)^{*}$-dominating (resp. (1, 2) ${ }^{*}$-total dominating) set if and only if it is both a dominating (resp. total dominating) and a hop dominating set. The concept of $(1,2)^{*}$-domination (a variation of (1,2)-domination) is introduced and investigated in [1].

A set $D \subseteq V(G)$ is a point-wise non-dominating set of $G$ if for each $v \in V(G) \backslash S$, there exists $u \in S$ such that $v \notin N_{G}(u)$. The smallest cardinality of a point-wise nondominating set of $G$, denoted by pnd $(G)$, is called the point-wise non-domination number of $G$. A dominating set $S$ which is also a point-wise non-dominating set of $G$ is called a dominating point-wise non-dominating set of $G$. The smallest cardinality of a dominating point-wise non-dominating set of $G$ will be denoted by $\gamma_{p n d}(G)$. Any point-wise nondominating (resp. dominating point-wise non-dominating) set $S$ of $G$ with $|S|=\operatorname{pnd}(G)$ (resp. $|S|=\gamma_{p n d}(G)$ ), is called a $p n d$-set (resp. $\gamma_{p n d}-$ set) of $G$.

## 2. Results

The first result, which will be needed later, is found in [1].

Proposition 1. [1] Let $G$ be a graph. Then $1 \leq \operatorname{pnd}(G) \leq|V(G)|$. Moreover,
(i) $\operatorname{pnd}(G)=|V(G)|$ if and only if $G$ is a complete graph;
(ii) $\operatorname{pnd}(G)=1$ if and only if $G$ has an isolated vertex; and
(iii) $\operatorname{pnd}(G)=2$ if and only if $G$ has no isolated vertex and there exist distinct vertices a and $b$ of $G$ such that $N_{G}(a) \cap N_{G}(b)=\varnothing$.

The join of graphs $G$ and $H$ is the graph $G+H$ with vertex set $V(G+H)=V(G) \cup$ $V(H)$ and edge set $E(G+H)=E(G) \cup E(H) \cup\{u v: u \in V(G)$ and $v \in V(H)\}$.

Theorem 1. Let $G$ and $H$ be any two graphs. A set $S \subseteq V(G+H)$ is hop dominating set of $G+H$ if and only if $S=S_{G} \cup S_{H}$, where $S_{G}$ and $S_{H}$ are point-wise non-dominating sets of $G$ and $H$, respectively.

Proof. Suppose that $S$ is a hop dominating set of $G+H$. Let $S_{G}=S \cap V(G)$ and $S_{H}=S \cap V(H)$. If $S_{G}$ were empty, then $S=S_{H}$. Since $V(G) \subseteq N_{G}(S)$, it follows that $S$ is not a hop dominating set, a contradiction. Thus, $S_{G} \neq \varnothing$. Similarly, $S_{H} \neq \varnothing$. Now let $v \in V(G) \backslash S_{G}$. Since $S$ is hop dominating set, there exists $z \in S$ such that $d_{G+H}(v, z)=2$. Hence, $z \in S_{G}$ and $v \notin N_{G}(z)$. This shows that $S_{G}$ is a point-wise non-dominating set of $G$. Similarly, $S_{H}$ is a point-wise non-dominating set of $H$.

For the converse, suppose that $S=S_{G} \cup S_{H}$, where $S_{G}$ and $S_{H}$ are point-wise nondominating sets of $G$ and $H$, respectively. Let $v \in V(G+H) \backslash S$. If $v \in V(G)$, then $v \in N_{G+H}\left(S_{H}\right)$. Since $S_{G}$ is a point-wise non-dominating set of $G$, there is a vertex $y \in S_{G} \backslash N_{G}(v)$. It follows that $d_{G+H}(v, y)=2$. The same argument can be used if $v \in V(H)$. Therefore $S$ is a hop dominating set of $G+H$.

The next result is a consequence of Theorem 1 and Proposition 1
Corollary 1. Let $G$ and $H$ be any two graphs of orders $m$ and $n$, respectively. Then

$$
\gamma_{h}(G+H)=\operatorname{pnd}(G)+\operatorname{pnd}(H) .
$$

In particular,
(i) $\gamma_{h}(G+H)=m+n$ if $G$ and $H$ are complete;
(ii) $\gamma_{h}(G+H)=2$ if $G$ and $H$ have isolated vertices;
(iii) $\gamma_{h}(G+H)=1+\operatorname{pnd}(H)$ if $G=K_{1}$;
(iv) $\gamma_{h}(G+H)=4$ if $G=P_{m}$ and $H=P_{n}(m, n \geq 2)$; and
(v) $\gamma_{h}(G+H)=4$ if $G=C_{m}$ and $H=C_{n}(m, n \geq 4)$.

The corona of graphs $G$ and $H$, denoted by $G \circ H$, is the graph obtained from $G$ by taking a copy $H^{v}$ of $H$ and forming the join $\langle v\rangle+H^{v}=v+H^{v}$ for each $v \in V(G)$.

Theorem 2. Let $G$ and $H$ be any two graphs. $A$ set $C \subseteq V(G \circ H)$ is a hop dominating set of $G \circ H$ if and only if

$$
C=A \cup\left(\cup_{v \in V(G) \cap N_{G}(A)} S_{v}\right) \cup\left(\cup_{w \in V(G) \backslash N_{G}(A)} E_{w}\right),
$$

where
(i) $A \subseteq V(G)$ such that for each $w \in V(G) \backslash A$, there exists $x \in A$ with $d_{G}(w, x)=2$ or there exists $y \in V(G) \cap N_{G}(w)$ with $V\left(H^{y}\right) \cap C \neq \varnothing$,
(ii) $S_{v} \subseteq V\left(H^{v}\right)$ for each $v \in V(G) \cap N_{G}(A)$, and
(iii) $E_{w} \subseteq V\left(H^{w}\right)$ is a point-wise non-dominating set of $H^{w}$ for each $w \in V(G) \backslash N_{G}(A)$.

Proof. Suppose $C$ is a hop dominating set of $G \circ H$ and set $A=C \cap V(G)$. Let $w \in V(G) \backslash A$. Then there exists $x \in C$ such that $d_{G \circ H}(w, x)=2$. If $x \in A$, then $d_{G}(w, x)=2$. Suppose that $x \notin A$. Then there exists $y \in V(G)$ such that $x \in V\left(H^{y}\right)$. Since $d_{G \circ H}(w, x)=2$, it follows that $y \in N_{G}(w)$. Thus, $(i)$ holds. Let $v \in V(G)$. Set $S_{v}=C \cap V\left(H^{v}\right)$ if $v \in V(G) \cap N_{G}(A)$ and $E_{w}=C \cap V\left(H^{w}\right)$ if $v \in V(G) \backslash N_{G}(A)$. Then, clearly, $S_{v} \subseteq V\left(H^{v}\right)$ and $E_{w} \subseteq V\left(H^{w}\right)$. Suppose that $w \in V(G) \backslash N_{G}(A)$ and let $q \in V\left(H^{w}\right) \backslash E_{w}$. Since $C$ is a hop dominating set of $G \circ H$, there exists $u \in C$ such that $d_{G \circ H}(q, u)=2$. By assumption, $u \notin A$. Thus, $u \in E_{w}$ and $q u \notin E\left(H^{w}\right)$. Therefore $E_{w}$ is a point-wise non-dominating set of $H^{w}$, showing that (iii) holds.

For the converse, suppose that $C$ has the given form and satisfies properties (i), (ii), and (iii). Let $z \in V(G \circ H) \backslash C$ and let $v \in V(G)$ such that $z \in V\left(v+H^{v}\right)$. Consider the following cases:

Case 1. $z=v$
Then $z \notin A$. From the assumption that (i) holds, it follows that there exists $y \in C$ such that $d_{G \circ H}(z, y)=2$.

Case 2. $z \neq v$
Then $z \in V\left(H^{v}\right)$. If $v \in N_{G}(A)$, say $v w \in E(G)$ for some $w \in A$, then $d_{G \circ H}(z, w)=2$. Suppose that $v \notin N_{G}(A)$. Then $z \in V\left(H^{v}\right) \backslash E_{v}$ where $E_{v}$ is a point-wise non-dominating set of $H^{v}$ by property (iii). Thus, there exists $p \in E_{v} \subset C$ such that $d_{G \circ H}(x, p)=2$.

Accordingly, $C$ is a hop dominating set of $G \circ H$.
Corollary 2. Let $G$ be a connected non-trivial graph and let $H$ be any graph. Then:
(i) $\quad \gamma_{h}(G \circ H) \leq \min \left\{\gamma_{1,2}^{* t}(G),[1+\operatorname{pnd}(H)] \gamma(G)\right\}$.
(ii) $\quad \gamma_{h}(G \circ H)=2$ if $\gamma_{1,2}^{* t}(G)=2$.
(iii) $\gamma_{h}(G \circ H)=2$ if $\gamma(G)=1$ and $H$ has an isolated vertex.

Let $A$ be a $\gamma_{1,2}^{* t}$-set of $G$. Since $A$ is a total dominating set of $G, V(G) \backslash N_{G}(A)=\varnothing$. Let $w \in V(G) \backslash A$. Since $A$ is a hop dominating set of $G$, there exists $x \in A$ such that $d_{G}(x, w)=2$. Setting $S_{v}=\varnothing$ for each $v \in A \cap N_{G}(A)=A$, we find that $C=A$ satisfies
conditions (i), (ii), and (iii) of Theorem 2. Thus, $C=A$ is a hop dominating set of $G \circ H$ and $\gamma_{h}(G \circ H) \leq|C|=|A|=\gamma_{1,2}^{* t}(G)$.

Next, let $A_{0}$ be a $\gamma$-set of $G$ and let $D_{0}$ be a $p n d$-set of $H$. Set $S_{v}=D_{v}$, where $D_{v} \subseteq V\left(H^{v}\right)$ and $\left\langle D_{v}\right\rangle \cong\langle D\rangle$, for each $v \in A_{0}$. Since $A_{0}$ is a dominating set of $G$, $w \in N_{G}\left(A_{0}\right)$ for each $w \in V(G) \backslash A_{0}$ (hence, $\left[V(G) \backslash A_{0}\right] \backslash N_{G}\left(A_{0}\right)=\varnothing$ ). Thus, by Theorem 2, $C_{0}=A_{0} \cup\left(\cup_{u \in A_{0}} S_{v}\right)$ is a hop dominating set of $G \circ H$, and $\gamma_{h}(G \circ H) \leq$ $\left|C_{0}\right|=\left|A_{0}\right|+\left|A_{0}\right| \cdot p n d(H)=[1+p n d(H)] \gamma(G)$. Therefore,

$$
\gamma_{h}(G \circ H) \leq \min \left\{\gamma_{1,2}^{* t}(G),[1+\operatorname{pnd}(H)] \gamma(G)\right\},
$$

showing that (i) holds. Statements (ii) and (iii) are immediate from (i) and the fact that $\gamma_{h}(G \circ H) \geq 2$.

Observation: The bound given in Corollary $2(i)$ is attainable (as given in (ii) and (iii)). It can also be verified easily that $\gamma_{h}\left(C_{5} \circ P_{3}\right)=\gamma_{1,2}^{* t}\left(C_{5}\right)=3<6=\left[1+\operatorname{pnd}\left(P_{3}\right)\right] \gamma\left(C_{5}\right)$ and $\gamma_{h}\left(K_{4} \circ P_{3}\right)=\left[1+\operatorname{pnd}\left(P_{3}\right)\right] \gamma\left(K_{4}\right)=3<4=\gamma_{1,2}^{* t}\left(K_{4}\right)$. It is worth noting that the inequality is also attainable. As a matter of fact, it can be shown that $\gamma_{h}\left(K_{5} \circ K_{4}\right)=3<$ $5=\min \left\{\left[1+\operatorname{pnd}\left(K_{4}\right)\right] \gamma\left(K_{5}\right), \gamma_{1,2}^{* t}\left(K_{5}\right)\right\}$.

The lexicographic product of graphs $G$ and $H$, denoted by $G[H]$, is the graph with vertex set $V(G[H])=V(G) \times V(H)$ such that $(v, a)(u, b) \in E(G[H])$ if and only if either $u v \in E(G)$ or $u=v$ and $a b \in E(H)$. Note that every non-empty subset $C$ of $V(G) \times V(H)$ can be expressed as $C=\cup_{x \in S}\left[\{x\} \times T_{x}\right]$, where $S \subseteq V(G)$ and $T_{x} \subseteq V(H)$ for each $x \in S$.

Theorem 3. Let $G$ and $H$ be connected non-trivial graphs. $A$ subset $C=\cup_{x \in S}\left[\{x\} \times T_{x}\right]$ of $V(G[H])$ is a hop dominating set of $G[H]$ if and only if the following conditions hold:
(i) $S$ is a hop dominating set of $G$;
(ii) $T_{x}$ is a point-wise non-dominating set of $H$ for each $x \in S$ with $\left|N_{G}(x, 2) \cap S\right|=0$.

Proof. Suppose $C$ is a hop dominating set of $G[H]$. Let $u \in V(G) \backslash S$ and pick any $a \in V(H)$. Since $C$ is a hop dominating set and $(u, a) \notin C$, there exists $(y, b) \in C$ such that $d_{G[H]}((u, a)(y, b))=2$. This implies that $y \in S$ and $d_{G}(u, y)=2$. Since $u$ was arbitrarily chosen, it follows that $S$ is a hop dominating set of $G$. Thus, $(i)$ holds.

Now let $x \in S^{*}$ and let $p \in V(H) \backslash T_{x}$. Then $(x, p) \notin C$. Again, noting that $C$ is a hop dominating set of $G[H]$, there exists $(z, q) \in C$ such that $d_{G[H]}((x, p)(z, q))=2$. By the assumption that $x \in S^{*}$, we find that $x=z$. Hence, $q \in T_{x}$ and $q \notin N_{H}(p)$. Thus, $T_{x}$ is a point-wise non-dominating set of $H$, showing that (ii) holds.

For the converse, suppose that $C$ satisfies properties $(i)$ and $(i i)$. Let $(v, t) \in V(G[H]) \backslash$ $C$ and consider the following cases:

Case 1. $v \notin S$
Since $S$ is a hop dominating set of $G$, there exists $w \in S$ such that $d_{G}(v, w)=2$. Pick any $d \in T_{w}$. Then $(w, d) \in C$ and $d_{G[H]}((v, t)(w, d))=2$.

Case 2. $v \in S$

If $v \notin S^{*}$, then there exists $z \in S$ such that $d_{G}(v, z)=2$. It follows that $d_{G[H]}((v, t)(z, a))=$ 2 for any $a \in T_{z}$. Suppose that $v \in S^{*}$. Then, by property (ii), there exists $c \in T_{v}$ such that $t c \notin E(H)$. Since $G$ is non-trivial and connected, $d_{G[H]}((v, t)(v, c))=2$.

Accordingly, $C$ is a hop dominating set of $G[H]$.
Lemma 1. A non-trivial graph $G$ admits a total hop dominating set if and only if $\gamma(C) \neq 1$ for every component $C$ of $G$.

Proof. Suppose $G$ admits a total hop dominating set, say $S$. Suppose further that there exists a component $C$ of $G$ such that $\gamma(C)=1$. Let $v \in V(C)$ be such that $\{v\}$ is a dominating set of $C$. Since $S$ is a hop dominating set of $G, v \in S$. This, however, contradicts the fact that $S$ is a total hop dominating set. Thus, $\gamma(C) \neq 1$ for every component $C$ of $G$.

For the converse, suppose that $\gamma(C) \neq 1$ for every component $C$ of $G$. Clearly, $S=$ $V(G)$ is a hop dominating set of $G$. Let $w \in V(G)$ and $C_{w}$ be the component of $G$ with $w \in V\left(C_{w}\right)$. Since $\{w\}$ is not a dominating set of $C_{w}$, there exists $u \in V(C) \backslash\{w\}$ such that $d_{C}(u, w)=d_{G}(u, w)=2$. This shows that $S=V(G)$ is a total hop dominating set of $G$.

Theorem 4. Let $G$ be a connected graph with $\gamma(G) \neq 1$. If $S$ is a hop dominating set of $G$, then $\gamma_{t h}(G) \leq\left|S \cap N_{G}(S, 2)\right|+2\left|S \backslash N_{G}(S, 2)\right|$. Moreover, $\gamma_{t h}(G) \leq 2 \gamma_{h}(G)$.

Proof. Let $S$ be a hop dominating set of $G$. If $S$ is a total hop dominating set of $G$ (possible by Lemma 1), then $S \cap N_{G}(S, 2)=S$ and $S \backslash N_{G}(S, 2)=\varnothing$. Hence, the inequality holds. Suppose now that $S$ is not a total hop dominating set. Then $S \backslash N_{G}(S, 2) \neq \varnothing$. Let $x \in S \backslash N_{G}(S, 2)$. Then, since $\gamma(G) \neq 1$, there exists $v_{x} \in V(G) \backslash S$ such that $d_{G}\left(x, v_{x}\right)=2$. Let $D_{S}=\left\{v_{x}: x \in S \backslash N_{G}(S, 2)\right\}$. Then, clearly, $\left|D_{S}\right| \leq\left|S \backslash N_{G}(S, 2)\right|$ and $S^{*}=S \cup D_{S}$ is a total hop dominating set of $G$. Thus,

$$
\gamma_{t h}(G) \leq\left|S^{*}\right| \leq\left|S \cap N_{G}(S, 2)\right|+2\left|S \backslash N_{G}(S, 2)\right| .
$$

In particular, $\gamma_{t h}(G) \leq 2 \gamma_{h}(G)$.
In what follows, $\rho_{H}(G)=\min \left\{\left|S \cap N_{G}(S, 2)\right|+\operatorname{pnd}(H)\left|S \backslash N_{G}(S, 2)\right|: S\right.$ is a hop dominating set of $\left.G\right\}$.
Corollary 3. Let $G$ and $H$ be non-trivial connected graphs of orders $m$ and $n$, respectively. Then
(i) $\gamma_{h}(G[H])=\rho_{H}(G)$ if $\gamma(G)=1$;
(ii) $\gamma_{h}(G[H])=\gamma_{\text {th }}(G)$ if $\gamma(G) \neq 1$; and
(iii) $\gamma_{h}(G[H])=m[p n d(H)]$ if $G=K_{m}$.

Proof. (i) Suppose first that $\gamma(G)=1$. Then, by Lemma 1, $G$ does not admit a total hop dominating set (hence, $\gamma_{h}(G[H]) \neq \gamma_{t h}(G)$ ). Now let $S^{\prime}$ be a hop dominating set of $G$ such that $\rho_{H}(G)=\left|S^{\prime} \cap N_{G}\left(S^{\prime}, 2\right)\right|+p n d(H)\left|S^{\prime} \backslash N_{G}\left(S^{\prime}, 2\right)\right|$, and let $D^{\prime}$ be a
pnd-set of $H$. Set $Q_{x}=D^{\prime}$ for each $x \in S^{\prime} \backslash N_{G}\left(S^{\prime}, 2\right)$ and $Q_{y}=\{q\}$, where $q \in V(H)$, for each $y \in S^{\prime} \cap N_{G}\left(S^{\prime}, 2\right)$. Then $C^{\prime}=\cup_{x \in S^{\prime}}\left\{\{x\} \times Q_{x}\right]$ is a hop dominating set of $G[H]$ by Theorem 3. Hence,

$$
\gamma_{h}(G[H]) \leq\left|C^{\prime}\right|=\sum_{x \in S^{\prime} \cap N_{G}\left(S^{\prime}, 2\right)}\left|Q_{x}\right|+\sum_{x \in S^{\prime} \backslash N_{G}\left(S^{\prime}, 2\right)}\left|Q_{x}\right|=\rho_{H}(G) .
$$

Next, suppose that $C_{0}=\cup_{x \in S_{0}}\left[\{x\} \times T_{x}\right]$ is a $\gamma_{h}$-set of $G[H]$. By Theorem $3, S_{0}$ is a hop dominating set of $G$ and $T_{x}$ is a pnd-set of $H$ for each $x \in S_{0} \backslash N_{G}\left(S_{0}, 2\right)$. Clearly, $\left|T_{x}\right|=1$ for all $x \in S_{0} \cap N_{G}\left(S_{0}, 2\right)$. Hence,

$$
\gamma_{h}(G[H])=\left|C_{0}\right|=\left|S_{0} \cap N_{G}\left(S_{0}, 2\right)\right|+\operatorname{pnd}(H)\left|S_{0} \backslash N_{G}\left(S_{0}, 2\right)\right| \geq \rho_{H}(G),
$$

showing that equality in ( $i$ ) holds.
(ii) Suppose that $\gamma(G) \neq 1$. Then $G$ admits a total hop dominating set by Lemma 1 . Let $S$ be a $\gamma_{t h}$-set of $G$ and let $D=\{a\}$, where $a \in V(H)$. Set $T_{x}=D$ for each $x \in S$. Then $C=\cup_{x \in S}\left[\{x\} \times T_{x}\right]=S \times D$ is a hop dominating set of $G[H]$ by Theorem 3. Hence,

$$
\gamma_{h}(G[H]) \leq|S||D|=\gamma_{t h}(G) .
$$

Next, suppose that $C^{*}=\cup_{x \in S^{*}}\left[\{x\} \times R_{x}\right]$ is a $\gamma_{h}$-set of $G[H]$. By Theorem 3, $S^{*}$ is a hop dominating set of $G$ and $R_{x}$ is a $p n d$-set of $H$ for each $x \in S^{*} \backslash N_{G}\left(S^{*}, 2\right)$. Since $C^{*}$ is a $\gamma_{h}$-set, $\left|R_{x}\right|=1$ for all $x \in S^{*} \cap N_{G}\left(S^{*}, 2\right)$. Moreover, since $H$ is a non-trivial connected graph, $\left|R_{x}\right|=\operatorname{pnd}(H) \geq 2$ for each $x \in S^{*} \backslash N_{G}\left(S^{*}, 2\right)$ by Proposition 1(ii). Thus, by Theorem 4,

$$
\gamma_{h}(G[H])=\left|C^{*}\right| \geq\left|S^{*} \cap N_{G}\left(S^{*}, 2\right)\right|+2\left|S^{*} \backslash N_{G}\left(S^{*}, 2\right)\right| \geq \gamma_{t h}(G) .
$$

This establishes the desired equality in (ii).
(iii) Suppose that $G=K_{m}$. Since $\gamma(G)=1, \gamma_{h}(G[H])=\rho_{H}(G)$. Now, since $S=$ $V\left(K_{m}\right)$ is the only hop dominating set of $G$, it follows that

$$
\gamma_{h}(G[H])=\rho_{H}(G)=m[\operatorname{pnd}(H)] .
$$

This proves the assertion in (iii).
Corollary 4. Let $G$ be a non-trivial connected graph and let $H$ be any non-trivial graph. If $H$ has an isolated vertex, then $\gamma_{h}(G[H])=\gamma_{h}(G)$.

Proof. Since $H$ has an isolated vertex, $\operatorname{pnd}(H)=1$ by Proposition 1(ii). Let $C=$ $\cup_{x \in S}\left[\{x\} \times T_{x}\right]$ be a $\gamma_{h}$-set of $G[H]$. By Theorem 3, S is a hop dominating set of $G$ and $T_{x}$ is a $p n d$-set of $H$ for each $x \in S \backslash N_{G}(S, 2)$. Further, since $C$ is $\gamma_{h}$-set, $\left|T_{x}\right|=1$ for all $x \in S \cap N_{G}(S, 2)$. Hence,

$$
\gamma_{h}(G[H])=|C|=\left|S \cap N_{G}(S, 2)\right|+\left|S \backslash N_{G}(S, 2)\right|=|S| \geq \gamma_{h}(G) .
$$

Now if $S_{0}$ is a $\gamma_{h}$-set of $G$ and $D_{0}$ is a $p n d$-set of $H$, then $C_{0}=S_{0} \times D_{0}$ is a $\gamma_{h}$-set of $G[H]$ by Theorem 3. Thus, $\gamma_{h}(G[H]) \leq\left|C_{0}\right|=\left|S_{0}\right|\left|D_{0}\right|=\left|S_{0}\right|=\gamma_{h}(G)$. This establishes the desired equality.

The Cartesian product of graphs $G$ and $H$, denoted by $G \square H$, is the graph with vertex set $V(G \square H)=V(G) \times V(H)$ such that $(v, p)(u, q) \in E(G \square H)$ if and only if $u v \in E(G)$ and $p=q \in E(H)]$ or $u=v$ and $p q \in E(H)$.

Theorem 5. Let $G$ and $H$ be connected non-trivial graphs. A subset $C=\cup_{x \in S}\left[\{x\} \times T_{x}\right]$ of $V(G \square H)$ is a hop dominating set of $G \square H$ if and only if the following conditions hold:
(i) For each $x \in V(G) \backslash S$ and for each $p \in V(H)$, at least one of the following statements is satisfied:
(a) There exists $y \in S \cap N_{G}(x)$ such that $T_{y} \cap N_{H}(p) \neq \varnothing$.
(b) There exists $z \in S \cap N_{G}(x, 2)$ such that $p \in T_{z}$.
(ii) For each $v \in S$ and for each $p \in V(H) \backslash T_{v}$, at least one of the following statements is satisfied:
(c) $N_{H}(p, 2) \cap T_{v} \neq \varnothing$.
(d) There exists $y \in S \cap N_{G}(v)$ such that $T_{y} \cap N_{H}(p) \neq \varnothing$.
(e) There exists $z \in S \cap N_{G}(v, 2)$ such that $p \in T_{z}$.

Proof. Suppose $C$ is a hop dominating set of $G \square H$. Let $x \in V(G) \backslash S$ and let $p \in V(H)$. Since $C$ is a hop dominating set and $(x, p) \notin C$, there exists $(y, q) \in C$ such that $d_{G \square H}((x, p)(y, q))=2$. Since $y \in S, x \neq y$. If $x y \in E(G)$, then $p q \in E(H)$. Hence, $q \in T_{y} \cap N_{H}(p)$, showing that (a) holds. So suppose that $y \notin N_{G}(x)$. Since $d_{G \square H}((x, p)(y, q))=2$, it follows that $y \in N_{G}(x, 2)$ and $p=q$. Hence, $p \in T_{y}$, showing that (b) holds.

Next, let $v \in S$ and let $p \in V(H) \backslash T_{v}$. Since $C$ is a hop dominating set and $(v, p) \notin C$, there exists $(w, q) \in C$ such that $d_{G \square H}((v, p)(w, q))=2$. Suppose that $(d)$ and $(e)$ do not hold. Then, since $d_{G \square H}((v, p)(w, q))=2, v=w$ and $d_{H}(p, q)=2$. Thus, $q \in T_{v} \cap N_{H}(p, 2)$, showing that ( $c$ ) holds.

For the converse, suppose that $C$ satisfies properties $(i)$ and $(i i)$. Let $(v, t) \in V(G[H]) \backslash$ $C$ and consider the following cases:

Case 1. $v \notin S$
If ( $a$ ) of ( $i$ ) holds, then there exist $y \in S \cap N_{G}(v)$ and $h \in T_{y} \cap N_{H}(p)$. Hence, $(y, h) \in C \cap N_{G \square H}((v, t), 2)$. If (b) of (i) holds, then there exists $z \in S \cap N_{G}(v, 2)$ such that $t \in T_{z}$. It follows that $(z, t) \in C \cap N_{G \square H}((v, t), 2)$.

Case 2. $v \in S$
Then $t \notin T_{v}$. If (c) of (ii) holds, then we may take any $q \in N_{H}(t, 2) \cap T_{v}$. Clearly, $(v, q) \in C \cap N_{G \square H}((v, t), 2)$. As in the first case, if (d) or (e) of (ii) holds, then there exists $(w, h) \in C \cap N_{G \square H}((v, t), 2)$.

Accordingly, $C$ is a hop dominating set of $G \square H$.

Corollary 5. Let $G$ and $H$ be non-trivial connected graphs. Then

$$
\gamma_{h}(G \square H) \leq \min \left\{\gamma(G) \gamma_{1,2}^{* t}(H), \gamma(H) \gamma_{1,2}^{* t}(G)\right\} .
$$

Proof. Let $S$ be a $\gamma$-set of $G$ and let $D$ be a $\gamma_{1,2}^{* t}$-set of $H$. Set $T_{x}=D$ for each $x \in S$ and let $C=\cup_{x \in S}\left[\{x\} \times T_{x}\right]=S \times D$. Let $x \in V(G) \backslash S$ and let $p \in V(H)$. Since $S$ is a dominating set of $G$, there exists $y \in S \cap N_{G}(x)$. Now, since $T_{y}=D$ is a total dominating set of $H$, there exists $q \in T_{y} \cap N_{H}(p)$. Thus, (a) of property ( $i$ ) of Theorem 5 holds. Next, let $v \in S$ and let $t \in V(H) \backslash T_{v}$. Since $T_{v}=D$ is a hop dominating set of $H, T_{v} \cap N_{H}(t, 2) \neq \varnothing$. Hence, (c) of property (ii) of Theorem 5 holds. Therefore, by Theorem 5, $C$ is a hop dominating set of $G \square H$. Thus, $\gamma_{h}(G \square H) \leq|C|=\gamma(G) \gamma_{1,2}^{* t}(H)$. This proves the assertion.

Remark 1. The bound given in Corollary 5 is tight. Moreover, the inequality is also attainable.

To see this, consider $P_{3} \square P_{4}$ and $P_{4} \square P_{4}$. It can easily be verified that $\gamma_{h}\left(P_{3} \square P_{4}\right)=$ $2=\gamma\left(P_{3}\right) \gamma_{1,2}^{* t}\left(P_{4}\right)$ and $\gamma_{h}\left(P_{4} \square P_{4}\right)=4=\gamma\left(P_{4}\right) \gamma_{1,2}^{* t}\left(P_{4}\right)$. The inequality is attainable since $\gamma_{h}\left(K_{4} \square K_{4}\right)=3<4=\gamma\left(K_{4}\right) \gamma_{1,2}^{* t}\left(K_{4}\right)$.
