# A Mathematical Framework for Modeling the Spread of HIV-disease within Two Different Age Classes 

Mahamadou Alassane ${ }^{1, *}$, Abdoulaye Samaké ${ }^{1}$, Amadou Mahamane ${ }^{1}$, Ouaténi Diallo ${ }^{1}$<br>${ }^{1}$ Université des Sciences, des Techniques et des Technologies de Bamako, BPE 423, Bamako, Mali

#### Abstract

In this paper, we propose a mathematical model for the spread of HIV disease within two different age classes. We define a basic reproduction number $\mathrm{R}_{0}$ that depends on the characteristics of the two age classes. We prove that if $\mathrm{R}_{0}<1$, then the disease is extinct in both age classes. In contrast, we prove that if $\mathrm{R}_{0}>1$, then the disease is endemic in both age classes.

Key Words and Phrases: HIV-AIDS, epidemic model, basic reproduction number, asymptotic stability, global stability, numerical simulations

## 1. Introduction

Acquired Immunodeficiency Syndrome (AIDS) is one the most deadly disease caused by a Human Immunodeficiency Virus (HIV). The virus destroys all the immune system, in particular the CD4 T-lymphocytes, and leaves individuals susceptible to any other infections. It multiplies within those lymphocytes and eventually destroys them. Once the lymphocytes are depleted, then the immune system stops functioning properly. As a result, the individual can catch any kind of disease that might kill him easily because of the failure of its immune system. However, there are drugs that can slow down the progression of the virus. HIV-AIDS is usually transmitted in three different ways, namely the sexual contact, blood transfusion, mother-to-child exchanges during pregnancy, childbirth and breastfeeding. Many mathematical models are used to study the impact of preventive control strategies on the spread of HIV-AIDS in given populations [1, 3, 5, 6, 9-14]. Some of these models have shown that a change in risky behavior is necessary to prevent the spread of HIV-AIDS, even in the presence of a treatment $[2,8]$.

In this paper, we study the spread of HIV-AIDS in the age structured populations. In fact, we consider two different age classes: A first class that corresponds to individuals aged

[^0]Email addresses: alassanemaiga@yahoo.fr (M. Alassane), abdoulaye.samake@usttb.edu.ml (A. Samaké), moulaye. ahmad@gmail.com (A. Mahamane), ouateni@yahoo.fr (O. Diallo)

25 years or less and a second class that corresponds to individuals aged over 25 years. We suppose that each age class is composed of susceptible and infected individuals. According to the Center of Disease Control (CDC), there are three main classes of HIV-AIDS infected individuals based on CD4 T-lymphocyte counts, see Table 1.

Table 1: Main classes of HIV-AIDS infected individuals

| Stages of infection | CD4 T-lymphocytes $/ \mathrm{mm}^{3}$ |
| :---: | :---: |
| Stage 1 | $>500$ |
| Stage 2 | $200<\mathrm{CD} 4 \mathrm{~T}<500$ |
| Stage 3 | $<200$ |

The first stage of infection occurs between two and six weeks after HIV infection. The infected individual begins to produce antibodies that are detectable by HIV tests. The individual is then called HIV-positive. The second stage of infection is characterized by a reduction in the number of viral particles in the blood, marking the beginning of the clinical latency phase of the infection. Finally, the third stage of infection is characterized by the presence of major infections.

We aim to capture the spread of HIV-AIDS in a population divided into two different age classes by a system of ordinary differential equations.

The paper is organized as follows. In Section 2, we formulate a mathematical model for HIV-AIDS. The basic properties of the model are given in Section 3. In Section 4, the disease-free equilibrium point (DFE) and the basic reproduction number $\mathrm{R}_{0}$ are calculated. In section 5, we prove the local extinction of the infected populations in both age classes when $R_{0}<1$. In Section 6, the global extinction of the disease in both age classes is studied and followed by some concluding results. Sections 7 and 8 deal with the persistence of the disease in both classes when $R_{0}>1$. In Section 9 , some numerical results are presented. The main conclusions are recapped in Section 10.

## 2. Mathematical Model for HIV-AIDS

In this section, we formulate a mathematical model for HIV-AIDS. We divide the total population N into two age classes. The first age class is denoted by $\mathrm{C}_{1}$ and the second by $\mathrm{C}_{2}$. In each age class, there is one compartment of susceptible individuals and three compartments of infected individuals. In the class $\mathrm{C}_{1}, \mathrm{~S}_{1}$ represents the compartment of susceptible individuals and $\mathrm{I}_{1}^{1}, \mathrm{I}_{1}^{2}$ and $\mathrm{I}_{1}^{3}$ are the compartments of infected individuals at stage 1,2 and 3 of infection, respectively. Similarly, in the class $\mathrm{C}_{2}, \mathrm{~S}_{2}$ is the compartment of susceptible individuals and $\mathrm{I}_{2}^{1}, \mathrm{I}_{2}^{2}$ and $\mathrm{I}_{2}^{3}$ represent the compartments of infected individuals at stage 1,2 and 3 of infection, respectively.

The total population N can be expressed as the following sum:

$$
N=\sum_{j=1}^{2} S_{j}+\sum_{j=1}^{3} \mathrm{I}_{1}^{\mathrm{j}}+\sum_{\mathrm{j}=1}^{3} \mathrm{I}_{2}^{\mathrm{j}} .
$$

The Spread of HIV-AIDS within two different age classes in the population is illustrated in Figure 1.

Figure 1: Flow diagram of HIV-AIDS transmission dynamics
Using the above representation, we formulate the corresponding dynamical model as follows:

The system (1) is completed with the following initial conditions:

$$
\begin{equation*}
\mathrm{S}_{1} \geq 0, \quad \mathrm{I}_{1}^{1} \geq 0, \quad \mathrm{I}_{1}^{2} \geq 0, \quad \mathrm{I}_{1}^{3} \geq 0, \quad \mathrm{~S}_{2} \geq 0, \quad \mathrm{I}_{2}^{1} \geq 0, \quad \mathrm{I}_{2}^{2} \geq 0, \quad \mathrm{I}_{2}^{3} \geq 0 \tag{2}
\end{equation*}
$$

Summing the equations of system (1), we obtain:

$$
\frac{\mathrm{d} N}{\mathrm{dt}}=(\mathrm{b}-\mathrm{m}) \mathrm{N} .
$$

The parameters of the model are reported in Table 2. They are all positive.
The parameter b represents the rate at which young begin sexual activity. The parameter m is the death rate. The parameters $\beta_{1}$ and $\beta_{2}$ are infection rates in $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$, respectively. The rate at which susceptible individuals in $\mathrm{C}_{1}$ get older and reach the age of becoming susceptible individuals in $\mathrm{C}_{2}$ is given by $\gamma$. The parameters $\mathrm{a}_{1}$ and $\mathrm{a}_{2}$ are the rates at which infected individuals in the class $\mathrm{C}_{1}$ move from stage 1 to stage 2 and from stage 2 to stage 3 , respectively, within this class. Similarly, the parameters $a_{3}$ and

Table 2: Description of the model parameters

| Parameters | Description |
| :--- | :--- |
| $\mathrm{b}, \mathrm{m}$ | Recruitment rate, natural mortality rate |
| $\gamma, \mathrm{c}_{1}, \mathrm{c}_{2}, \mathrm{c}_{3}$ | Transfer rates from $\mathrm{C}_{1}$ to $\mathrm{C}_{2}$ |
| $\mathrm{a}_{1}, \mathrm{a}_{2}$ | Transfer rates within $\mathrm{C}_{1}$ |
| $\mathrm{a}_{3}, \mathrm{a}_{4}$ | Transfer rates within $\mathrm{C}_{2}$ |
| $\beta_{1}, \beta_{2}$ | Transmission rates |

$\mathrm{a}_{4}$ describe the rates at which infected individuals in the class $\mathrm{C}_{2}$ move from stage 1 to stage 2 and from stage 2 to stage 3 , respectively, within this class. The parameters $\mathrm{c}_{k}$, $k=1,2,3$, denote the rates at which infected individuals in the stage $k$ of $\mathrm{C}_{1}$ get older and reach the age of becoming infected individuals in the stage $k$ of $\mathrm{C}_{2}$.

For the mathematical analysis of the model, we introduce the following scalings:

$$
\begin{equation*}
\mathrm{s}_{1}=\frac{\mathrm{S}_{1}}{\mathrm{~N}}, \quad \mathrm{i}_{1}^{1}=\frac{\mathrm{I}_{1}^{1}}{\mathrm{~N}}, \quad \mathrm{i}_{1}^{2}=\frac{\mathrm{I}_{1}^{2}}{\mathrm{~N}}, \quad \mathrm{i}_{1}^{3}=\frac{\mathrm{I}_{1}^{1}}{\mathrm{~N}}, \quad \mathrm{~s}_{2}=\frac{\mathrm{S}_{2}}{\mathrm{~N}}, \quad \mathrm{i}_{2}^{1}=\frac{\mathrm{I}_{2}^{1}}{\mathrm{~N}}, \quad \mathrm{i}_{2}^{2}=\frac{\mathrm{I}_{2}^{2}}{\mathrm{~N}}, \quad \mathrm{i}_{2}^{3}=\frac{\mathrm{I}_{2}^{3}}{\mathrm{~N}} . \tag{3}
\end{equation*}
$$

From the equation 3, it holds:

$$
\begin{equation*}
\sum_{\mathrm{j}=1}^{2} \mathrm{~s}_{\mathrm{j}}+\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}=1 . \tag{4}
\end{equation*}
$$

According to the new variables, the system (1) can be rewritten as follows:
where
$\kappa_{1}=\mathrm{b}+\gamma, \quad \kappa_{2}=\mathrm{b}+\mathrm{a}_{1}+\mathrm{c}_{1}, \quad \kappa_{3}=\mathrm{b}+\mathrm{a}_{2}+\mathrm{c}_{2}, \quad \kappa_{4}=\mathrm{b}+\mathrm{c}_{3}, \quad \kappa_{5}=\mathrm{b}+\mathrm{a}_{3}, \quad \kappa_{6}=\mathrm{b}+\mathrm{a}_{4}$.
After normalization of the initial data, we obtain:

$$
\begin{equation*}
\sum_{\mathrm{j}=1}^{2} \mathrm{~s}_{\mathrm{j}}(0)+\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}(0)+\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}(0)=1 \tag{6}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathrm{s}_{1}(0) \geq 0, \mathrm{i}_{1}^{1}(0) \geq 0, \mathrm{i}_{1}^{2}(0) \geq 0, \mathrm{i}_{1}^{3}(0) \geq 0, \mathrm{~s}_{2}(0) \geq 0, \mathrm{i}_{2}^{1}(0) \geq 0, \mathrm{i}_{2}^{2}(0) \geq 0, \mathrm{i}_{2}^{3}(0) \geq 0 \tag{7}
\end{equation*}
$$

The variables of the model (5) are reported in Table 3.

Table 3: Variables for the re-scaled HIV-AIDS model

| Variables | Description |
| :--- | :--- |
| $\mathrm{s}_{1}$ | Proportion of susceptible individuals in class $\mathrm{C}_{1}$ |
| $\mathrm{~s}_{2}$ | Proportion of susceptible individuals in class $\mathrm{C}_{2}$ |
| $\mathrm{i}_{1}^{1}$ | Proportion of individuals at stage 1 of infection in $\mathrm{C}_{1}$ |
| $\mathrm{i}_{1}^{2}$ | Proportion of individuals at stage 2 of infection in $\mathrm{C}_{1}$ |
| $\mathrm{i}_{1}^{3}$ | Proportion of individuals at stage 3 of infection in $\mathrm{C}_{1}$ |
| $\mathrm{i}_{2}^{1}$ | Proportion of individuals at stage 1 of infection in $\mathrm{C}_{2}$ |
| $\mathrm{i}_{2}^{2}$ | Proportion of individuals at stage 2 of infection in $\mathrm{C}_{2}$ |
| $\mathrm{i}_{2}^{3}$ | Proportion of individuals at stage 3 of infection in $\mathrm{C}_{2}$ |

## 3. Basic Properties

## Theorem 1.

The feasible region $\Gamma$ defined by

with the initial conditions

$$
\mathrm{s}_{1}(0) \geq 0, \mathrm{i}_{1}^{1}(0) \geq 0, \mathrm{i}_{1}^{2}(0) \geq 0, \mathrm{i}_{1}^{3}(0) \geq 0, \mathrm{~s}_{2}(0) \geq 0, \mathrm{i}_{2}^{1}(0) \geq 0, \mathrm{i}_{2}^{2}(0) \geq 0, \mathrm{i}_{2}^{3}(0) \geq 0
$$

is a positively invariant set for the system (5).

## Proof. 1. Positivity of Solutions

We show by absurd that for all $t \geq 0, e(t) \geq 0$. Suppose that for a time $t^{\prime}>0$, we have $\mathrm{e}\left(\mathrm{t}^{\prime}\right)<0$. The function e being continuous, from the intermediate value theorem, there exists a time $\left.\mathrm{t}_{1} \in\right] 0, \mathrm{t}$ ' $\left[\right.$ such that $\mathrm{e}\left(\mathrm{t}_{1}\right)=0$.
Consider the equations of system (5) and let:

$$
\begin{aligned}
& \xi_{1}(t)=\exp \left[\int_{0}^{\mathrm{t}}\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}+\kappa_{1}\right) \mathrm{d} \tau\right], \quad \xi_{3}(\mathrm{t})=\exp \left(\int_{0}^{\mathrm{t}}\left(\kappa_{2}-\beta_{1} \mathrm{~s}_{1}\right) \mathrm{d} \tau\right), \\
& \xi_{2}(\mathrm{t})=\exp \left(\kappa_{3} \mathrm{t}\right), \quad \xi_{4}(\mathrm{t})=\exp \left(\kappa_{4} \mathrm{t}\right), \quad \xi_{5}(\mathrm{t})=\exp \left(\kappa_{6} \mathrm{t}\right), \quad \xi_{7}(\mathrm{t})=\exp (\mathrm{bt}) \\
& \xi_{6}(\mathrm{t})=\exp \left(\int_{0}^{\mathrm{t}}\left(\kappa_{5}-\beta_{2} \mathrm{~s}_{2}\right) \mathrm{d} \tau\right), \quad \xi_{8}(t)=\exp \left[\int_{0}^{\mathrm{t}}\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}+\mathrm{b}\right) \mathrm{d} \tau\right]
\end{aligned}
$$

By differentiating each of the expressions $\mathrm{s}_{1} \xi_{1}, \mathrm{i}_{1}^{1} \xi_{3}, \mathrm{i}_{1}^{2} \xi_{2}, \mathrm{i}_{1}^{3} \xi_{4}, \mathrm{~s}_{2} \xi_{8}, \mathrm{i}_{2}^{1} \xi_{5}, \mathrm{i}_{2}^{2} \xi_{6}$ and $\mathrm{i}_{2}^{3} \xi_{7}$ with respect to time $t$, we obtain:

$$
\begin{align*}
\frac{\mathrm{ds}_{1} \xi_{1}}{\mathrm{dt}} & =\mathrm{b} \xi_{1}  \tag{8a}\\
\frac{\mathrm{di}_{1}^{1} \xi_{3}}{\mathrm{dt}} & =\mathrm{s}_{1} \xi_{3}\left(\beta_{1} \sum_{\mathrm{j}=2}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right)  \tag{8b}\\
\frac{\mathrm{di}_{1}^{2} \xi_{2}}{\mathrm{dt}} & =\mathrm{a}_{1} \mathrm{i}_{1}^{1} \xi_{2}  \tag{8c}\\
\frac{\mathrm{di}{ }_{1}^{3} \xi_{4}}{\mathrm{dt}} & =\mathrm{a}_{2} \mathrm{i}_{1}^{2} \xi_{4}  \tag{8d}\\
\frac{\mathrm{ds}_{2} \xi_{8}}{\mathrm{dt}} & =\gamma \mathrm{s}_{1} \xi_{8}  \tag{8e}\\
\frac{\mathrm{di}_{2}^{1} \xi_{6}}{\mathrm{dt}} & =\xi_{6}\left(\beta_{1} \mathrm{~s}_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \mathrm{~s}_{2} \sum_{\mathrm{j}=2}^{3} \mathrm{i}_{2}^{\mathrm{j}}+\mathrm{c}_{1} \mathrm{i}_{1}^{1}\right)  \tag{8f}\\
\frac{\mathrm{di}_{2}^{2} \xi_{5}}{\mathrm{dt}} & =\left(\mathrm{a}_{3} \mathrm{i}_{2}^{1}+\mathrm{c}_{2} \mathrm{i}_{1}^{2}\right) \xi_{5}  \tag{8g}\\
\frac{\mathrm{di}_{2}^{3} \xi_{7}}{\mathrm{dt}} & =\left(\mathrm{a}_{4} \mathrm{i}_{2}^{2}+\mathrm{c}_{3} \mathrm{i}_{1}^{3}\right) \xi_{7} \tag{8h}
\end{align*}
$$

By integrating the equations (8a)-(8h) between 0 and $t_{1}$, it holds:

$$
\begin{align*}
& \mathrm{s}_{1}\left(\mathrm{t}_{1}\right)=\frac{1}{\xi_{1}\left(\mathrm{t}_{1}\right)}\left[\mathrm{s}_{1}(0)+\int_{0}^{\mathrm{t}_{1}} \mathrm{~b} \xi_{1} \mathrm{dt}\right]>0  \tag{9a}\\
& \mathrm{i}_{1}^{1}\left(\mathrm{t}_{1}\right)=\frac{1}{\xi_{3}\left(\mathrm{t}_{1}\right)}\left[\mathrm{i}_{1}^{1}(0)+\int_{0}^{\mathrm{t}_{1}} \mathrm{~s}_{1} \xi_{3}\left(\beta_{1} \sum_{\mathrm{j}=2}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right) \mathrm{dt}\right]>0  \tag{9b}\\
& \mathrm{i}_{1}^{2}\left(\mathrm{t}_{1}\right)=\frac{1}{\xi_{2}\left(\mathrm{t}_{1}\right)}\left[\mathrm{i}_{1}^{2}(0)+\int_{0}^{\mathrm{t}_{1}} \mathrm{a}_{1} \xi_{2} \mathrm{i}_{1}^{1} \mathrm{dt}\right]>0  \tag{9c}\\
& \mathrm{i}_{1}^{3}\left(\mathrm{t}_{1}\right)=\frac{1}{\xi_{4}\left(\mathrm{t}_{1}\right)}\left[\mathrm{i}_{1}^{3}(0)+\int_{0}^{\mathrm{t}_{1}} \mathrm{a}_{2} \xi_{4} \mathrm{i}_{1}^{2} \mathrm{dt}\right]>0  \tag{9d}\\
& \mathrm{~s}_{2}\left(\mathrm{t}_{1}\right)=\frac{1}{\xi_{8}\left(\mathrm{t}_{1}\right)}\left[\mathrm{s}_{2}(0)+\int_{0}^{\mathrm{t}_{1}} \gamma \mathrm{~s}_{1} \xi_{8} \mathrm{dt}\right]>0  \tag{9e}\\
& \mathrm{i}_{2}^{1}\left(\mathrm{t}_{1}\right)=\frac{1}{\xi_{6}\left(\mathrm{t}_{1}\right)}\left[\mathrm{i}_{2}^{1}(0)+\int_{0}^{\mathrm{t}_{1}} \xi_{6}\left(\beta_{1} \mathrm{~s}_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \mathrm{~s}_{2} \sum_{\mathrm{j}=2}^{3} \mathrm{i}_{2}^{\mathrm{j}}+\mathrm{c}_{1} \mathrm{i}_{1}^{1}\right) \mathrm{dt}\right]>0  \tag{9f}\\
& \mathrm{i}_{2}^{2}\left(\mathrm{t}_{1}\right)=\frac{1}{\xi_{5}\left(\mathrm{t}_{1}\right)}\left[\mathrm{i}_{2}^{2}(0)+\int_{0}^{\mathrm{t}_{1}}\left(\mathrm{a}_{3} 2_{2}^{1}+\mathrm{c}_{2} \mathrm{i}_{1}^{2}\right) \xi_{5} \mathrm{dt}\right]>0  \tag{9~g}\\
& \mathrm{i}_{2}^{3}\left(\mathrm{t}_{1}\right)=\frac{1}{\xi_{7}\left(\mathrm{t}_{1}\right)}\left[\mathrm{i}_{2}^{3}(0)+\int_{0}^{\mathrm{t}_{1}}\left(\mathrm{a}_{4} 4_{2}^{2}+\mathrm{c}_{3} \mathrm{i}_{1}^{3}\right) \xi_{7} \mathrm{dt}\right]>0 \tag{9h}
\end{align*}
$$

From (9a)-(9h), it follows that $\mathrm{e}\left(\mathrm{t}_{1}\right)>0$. This is a contradiction according to the starting hypothesis. Then, $\forall \mathrm{t} \geq 0, \mathrm{e}(\mathrm{t}) \geq 0$. Therefore, all solutions initiated in $\mathbb{R}_{+}^{8}$ are positive.

## 2. Invariant Region

Summing the equations of system (5), we obtain:

$$
\begin{equation*}
\frac{\mathrm{d}}{\mathrm{dt}}\left(\mathrm{~s}_{1}+\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\mathrm{s}_{2}+\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right)=0 . \tag{10}
\end{equation*}
$$

Integrating (10) using initial conditions, it holds:

$$
\forall \mathrm{t} \geq 0, \quad \mathrm{~s}_{1}(\mathrm{t})+\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}(\mathrm{t})+\mathrm{s}_{2} \mathrm{t}+\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}(\mathrm{t}) \leq 1
$$

This achieves the proof.
Consequently, in $\Gamma$, the model (5) is epidemiologically and mathematically well-posed. Therefore, it is sufficient to study the dynamics of the model in $\Gamma$.

## 4. Disease-Free Equilibrium (DFE) $\mathbf{E}_{0}$ and Reproduction Number $\mathbf{R}_{0}$

The Disease-Free Equilibrium (DFE) $\mathrm{E}_{0}$ of the model (5) is determined by solving the following system:

$$
\left\{\begin{array}{l}
\frac{\mathrm{d} \mathrm{~s}_{1}}{\mathrm{dt}}=0  \tag{11}\\
\frac{\mathrm{di}_{1}^{1}}{\mathrm{dt}}=0 \\
\frac{\mathrm{di}_{1}^{2}}{\mathrm{dt}}=0 \\
\frac{\mathrm{di}_{1}^{3}}{\mathrm{dt}}=0 \\
\frac{\mathrm{~d} \mathrm{~s}_{2}}{\mathrm{dt}}=0 \\
\frac{\mathrm{~d} \mathrm{i}_{2}^{1}}{\mathrm{dt}}=0 \\
\frac{\mathrm{di}_{2}^{2}}{\mathrm{dt}}=0 \\
\frac{\mathrm{~d} \mathrm{i}_{2}^{3}}{\mathrm{dt}}=0
\end{array}\right.
$$

In the case of absence of disease, i.e. the population size is zero in all compartments except the susceptible compartment, the solution of (11) is given by:

$$
\mathrm{E}_{0}\left(\frac{\mathrm{~b}}{\kappa_{1}}, 0,0,0, \frac{\gamma}{\kappa_{1}}, 0,0,0\right) .
$$

We determine the basic reproduction number $\mathrm{R}_{0}$ using the next generation matrix method at Disease-Free Equilibrium [12]. According to this method, $\mathrm{R}_{0}$ is defined as the effective number of secondary infections caused by typical infected individual during his/her entire period of infectioussness $[1,4]$. Let X be the vector of infected classes:

$$
\begin{aligned}
& \mathrm{X}=\left(\mathrm{i}_{1}^{1}, \quad \mathrm{i}_{1}^{2}, \quad \mathrm{i}_{1}^{3}, \quad \mathrm{i}_{2}^{1}, \quad \mathrm{i}_{2}^{2}, \quad \mathrm{i}_{2}^{3}\right)^{\mathrm{T}} . \\
& \mathrm{F}=\left(\mathrm{s}_{1}\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right), \quad 0, \quad 0, \quad \mathrm{~s}_{2}\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right), \quad 0, \quad 0\right)^{\mathrm{T}}
\end{aligned}
$$

denotes the vector of terms corresponding to new infections.

$$
\mathrm{V}=\left(\kappa_{2} \mathrm{i}_{1}^{1}, \kappa_{3} \mathrm{i}_{1}^{2}-\mathrm{a}_{1} \mathrm{i}_{1}^{1}, \kappa_{4} \mathrm{i}_{1}^{3}-\mathrm{a}_{2} \mathrm{i}_{1}^{2}, \kappa_{5} \mathrm{i}_{2}^{1}-\mathrm{c}_{1} \mathrm{i}_{1}^{1}, \kappa_{6} \mathrm{i}_{2}^{2}-\mathrm{c}_{2} \mathrm{i}_{1}^{2}-\mathrm{a}_{3} \dot{1}_{2}^{1}, \mathrm{~b} \mathrm{i}_{2}^{3}-\mathrm{c}_{3} \mathrm{i}_{1}^{3}-\mathrm{a}_{4} \mathrm{i}_{2}^{2}\right)^{\mathrm{T}}
$$

refers to the vector of terms corresponding to individuals entering a given compartment and individuals leaving.

The partial derivatives of F and V with respect to $\mathrm{i}_{1}^{1}, \mathrm{i}_{1}^{2}, \mathrm{i}_{1}^{3}, \mathrm{i}_{2}^{1}, \mathrm{i}_{2}^{2}$ and $\mathrm{i}_{2}^{3}$ are given by the following matrices $\mathcal{F}$ and $\mathcal{V}$ :
$\mathcal{F}=\left(\begin{array}{llllll}\beta_{1} \frac{\mathrm{~b}}{\kappa_{1}} & \beta_{1} \frac{\mathrm{~b}}{\kappa_{1}} & \beta_{1} \frac{\mathrm{~b}}{\kappa_{1}} & \beta_{2} \frac{\mathrm{~b}}{\kappa_{1}} & \beta_{2} \frac{\mathrm{~b}}{\kappa_{1}} & \beta_{2} \frac{\mathrm{~b}}{\kappa_{1}} \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \\ \beta_{1} \frac{\gamma}{\kappa_{1}} & \beta_{1} \frac{\gamma}{\kappa_{1}} & \beta_{1} \frac{\gamma}{\kappa_{1}} & \beta_{2} \frac{\gamma}{\kappa_{1}} & \beta_{2} \frac{\gamma}{\kappa_{1}} & \beta_{2} \frac{\gamma}{\kappa_{1}} \\ 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0\end{array}\right), \mathcal{V}=\left(\begin{array}{cccccc}\kappa_{2} & 0 & 0 & 0 & 0 & 0 \\ -\mathrm{a}_{1} & \kappa_{3} & 0 & 0 & 0 & 0 \\ 0 & -\mathrm{a}_{2} & \kappa_{4} & 0 & 0 & 0 \\ -\mathrm{c}_{1} & 0 & 0 & \kappa_{5} & 0 & 0 \\ 0 & -\mathrm{c}_{2} & 0 & -\mathrm{a}_{3} & \kappa_{6} & 0 \\ 0 & 0 & -\mathrm{c}_{3} & 0 & -\mathrm{a}_{4} & \mathrm{~b}\end{array}\right)$
The next-generation matrix is defined by:

$$
K=\mathcal{F} \mathcal{V}^{-1}=\frac{1}{\mathrm{M}_{7}}\left(\begin{array}{cccccc}
\mathrm{M}_{1} \mathrm{~b} & \mathrm{M}_{2} \mathrm{~b} & \mathrm{M}_{3} b & \mathrm{M}_{4} \mathrm{~b} & \mathrm{M}_{5} b & \mathrm{M}_{6} b \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
\mathrm{M}_{1} \gamma & \mathrm{M}_{2} \gamma & \mathrm{M}_{3} \gamma & \mathrm{M}_{4} \gamma & \mathrm{M}_{5} \gamma & \mathrm{M}_{6} \gamma \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0
\end{array}\right)
$$

where

$$
\begin{align*}
\mathrm{M}_{1}= & \beta_{1} \mathrm{~b} \kappa_{3} \kappa_{4} \kappa_{5} \kappa_{6}+\mathrm{a}_{1} \beta_{1} \mathrm{~b} \kappa_{4} \kappa_{5} \kappa_{6}+\beta_{1} \mathrm{a}_{1} \mathrm{a}_{2} \mathrm{~b} \kappa_{5} \kappa_{6}+\beta_{2} \mathrm{c}_{1} \mathrm{~b} \kappa_{3} \kappa_{4} \kappa_{6}+\beta_{2} \mathrm{c}_{2} \mathrm{a}_{1} \mathrm{~b} \kappa_{4} \kappa_{5} \\
& +\beta_{2} \mathrm{a}_{3} \mathrm{c}_{1} \mathrm{~b} \kappa_{3} \kappa_{4}+\beta_{2} \mathrm{c}_{3} \mathrm{a}_{2} \mathrm{a}_{1} \kappa_{5} \kappa_{6}+\beta_{2} \mathrm{a}_{4} \mathrm{a}_{1} \mathrm{c}_{2} \kappa_{4} \kappa_{5}+\beta_{2} \mathrm{a}_{4} \mathrm{a}_{3} \mathrm{c}_{1} \kappa_{3} \kappa_{4}  \tag{12}\\
\mathrm{M}_{2}= & \beta_{1} \mathrm{~b} \kappa_{2} \kappa_{4} \kappa_{5} \kappa_{6}+\beta_{1} \mathrm{a}_{2} \mathrm{~b} \kappa_{2} \kappa_{5} \kappa_{6}+\beta_{2} \mathrm{c}_{2} \mathrm{~b} \kappa_{2} \kappa_{4} \kappa_{5}+\beta_{2} \mathrm{c}_{3} \mathrm{a}_{2} \kappa_{2} \kappa_{5} \kappa_{6} \\
& +\beta_{2} \mathrm{a}_{4} \mathrm{c}_{2} \kappa_{2} \kappa_{4} \kappa_{5}  \tag{13}\\
\mathrm{M}_{3}= & \beta_{1} \mathrm{~b} \kappa_{2} \kappa_{3} \kappa_{5} \kappa_{6}+\beta_{2} \mathrm{c}_{3} \kappa_{2} \kappa_{3} \kappa_{5} \kappa_{6}  \tag{14}\\
\mathrm{M}_{4}= & \beta_{2} \mathrm{~b} \kappa_{2} \kappa_{3} \kappa_{4} \kappa_{6}+\beta_{2} \mathrm{a}_{3} \mathrm{~b} \kappa_{2} \kappa_{3} \kappa_{4}+\beta_{2} \mathrm{a}_{3} \mathrm{a}_{4} \kappa_{2} \kappa_{3} \kappa_{4}  \tag{15}\\
\mathrm{M}_{5}= & \beta_{2} \mathrm{~b} \kappa_{2} \kappa_{3} \kappa_{4} \kappa_{5}+\beta_{2} \mathrm{a}_{4} \kappa_{2} \kappa_{3} \kappa_{4} \kappa_{5}  \tag{16}\\
\mathrm{M}_{6}= & \beta_{2} \kappa_{2} \kappa_{3} \kappa_{4} \kappa_{5} \kappa_{6}  \tag{17}\\
\mathrm{M}_{7}= & \mathrm{b} \kappa_{1} \kappa_{2} \kappa_{3} \kappa_{4} \kappa_{5} \kappa_{6} \tag{18}
\end{align*}
$$

The basic reproduction number $\mathrm{R}_{0}$, computed from the spectral raduis of the nextgeneration matrix K , is given by:

$$
\begin{equation*}
\mathrm{R}_{0}=\frac{\mathrm{b} \mathrm{M}_{1}+\gamma \mathrm{M}_{4}}{\mathrm{M}_{7}} \tag{19}
\end{equation*}
$$

where $M_{1}, M_{4}$ and $M_{7}$ are explicitly defined by (12), (15) and (18).

## 5. Local Stability of Disease-Free Equilibrium (DFE)

## Theorem 2.

If $\mathrm{R}_{0}<1$, then the disease-free equilibrium point

$$
\mathrm{E}_{0}\left(\frac{\mathrm{~b}}{\kappa_{1}}, 0,0,0, \frac{\gamma}{\kappa_{1}}, 0,0,0\right)
$$

is locally asymptotically stable.
Proof. Consider the system (5). The jacobian of this system at $\mathrm{E}_{0}$ is denoted by $\mathrm{J}\left(\mathrm{E}_{0}\right)$ and its eigenvalues are the solutions of the following equations:

$$
r_{8} X^{8}+r_{7} X^{7}+r_{6} X^{6}+r_{5} X^{5}+r_{4} X^{4}+r_{3} X^{3}+r_{2} X^{2}+r_{1} X+r_{0}=0
$$

Let us define:

$$
\begin{aligned}
& \mathrm{f}_{1}=-\mathrm{a}_{1} \kappa_{5} \mathrm{a}_{4} \mathrm{c}_{2} \kappa_{4} \beta_{2} \mathrm{~b}-\mathrm{a}_{1} \mathrm{a}_{2} \kappa_{5} \kappa_{6} \mathrm{~b}^{2} \beta_{1}-\gamma \beta_{2} \kappa_{6} \mathrm{~b} \kappa_{4} \kappa_{3} \kappa_{2}-\mathrm{a}_{3} \gamma \mathrm{a}_{4} \kappa_{4} \kappa_{3} \kappa_{2} \beta_{2} \mathrm{a}_{1} \kappa_{5} \kappa_{6} \mathrm{~b}^{2} \kappa_{4} \beta_{1} \\
& -\mathrm{a}_{3} \mathrm{a}_{4} \kappa_{4} \kappa_{3} \mathrm{c}_{1} \beta_{2} \mathrm{~b} \\
& \mathrm{f}_{2}=-\beta_{2} \mathrm{~b}^{2} \kappa_{6} \kappa_{4} \kappa_{3} \mathrm{c}_{1}-\mathrm{a}_{1} \mathrm{a}_{2} \mathrm{c}_{3} \kappa_{5} \kappa_{6} \beta_{2} \mathrm{~b}-\mathrm{a}_{3} \beta_{2} \mathrm{~b}^{2} \kappa_{4} \kappa_{3} \mathrm{c}_{1}-\kappa_{5} \kappa_{6} \mathrm{~b}^{2} \kappa_{4} \kappa_{3} \beta_{1}-\mathrm{a}_{3} \gamma \beta_{2} \mathrm{~b} \kappa_{4} \kappa_{3} \kappa_{2} \\

& +\kappa_{1} \kappa_{5} \kappa_{4} \\
& \mathrm{f}_{36}=-\kappa_{6} \mathrm{~b} \beta_{1}+\kappa_{1} \kappa_{6} \kappa_{2}-\kappa_{3} \beta_{1} \mathrm{~b}-\beta_{1} \mathrm{ba}_{1}+\kappa_{1} \kappa_{3} \kappa_{2}-\beta_{2} \mathrm{bc}_{1}-\kappa_{5} \mathrm{~b} \beta_{1}-\gamma \beta_{2} \kappa_{2}+\kappa_{1} \kappa_{5} \kappa_{2}-\gamma \beta_{2} \kappa_{3} \\
& +\kappa_{1} \kappa_{5} \kappa_{3} \\
& \mathrm{f}_{37}=\kappa_{1} \kappa_{6}-\beta_{1} \mathrm{~b}+\kappa_{1} \kappa_{5}-\gamma \beta_{2}+\kappa_{1} \mathrm{~b}+\kappa_{1} \kappa_{4}+\kappa_{2} \kappa_{1}+\kappa_{1} \kappa_{3}
\end{aligned}
$$

and
$\mathrm{F}_{1}=\mathrm{f}_{1}+\mathrm{f}_{2}+\mathrm{f}_{3} ; \quad \mathrm{F}_{2}=\mathrm{f}_{13}+\mathrm{f}_{14}+\mathrm{f}_{15}+\mathrm{f}_{16}+\mathrm{f}_{17}+\mathrm{f}_{18}+\mathrm{f}_{19}+\mathrm{f}_{20}+\mathrm{f}_{21}+\mathrm{f}_{22}+\mathrm{f}_{23}+\mathrm{f}_{24}+\mathrm{f}_{25}+\mathrm{f}_{26}$
$\mathrm{F}_{3}=\mathrm{f}_{4}+\mathrm{f}_{5}+\mathrm{f}_{6}+\mathrm{f}_{7}+\mathrm{f}_{8}+\mathrm{f}_{9}+\mathrm{f}_{10}+\mathrm{f}_{11}+\mathrm{f}_{12} ; \quad \mathrm{F}_{4}=\mathrm{f}_{27}+\mathrm{f}_{28}+\mathrm{f}_{29}+\mathrm{f}_{30}+\mathrm{f}_{31}+\mathrm{f}_{32}+\mathrm{f}_{33}+\mathrm{f}_{34}$
$\mathrm{F}_{5}=\mathrm{f}_{35}+\mathrm{f}_{36} ; \quad \mathrm{F}_{6}=\mathrm{f}_{37}$.
Then

$$
\begin{aligned}
& \mathrm{r}_{8}=1, \quad \mathrm{r}_{7}=\frac{1}{\kappa_{1}}\left(\mathrm{~F}_{6}+\kappa_{1} \mathrm{~b}+\kappa_{1}^{2}\right), \quad \mathrm{r}_{6}=\frac{1}{\kappa_{1}}\left[\mathrm{~F}_{5}+\mathrm{F}_{6}\left(\kappa_{1}+\mathrm{b}\right)+\kappa_{1}^{2} \mathrm{~b}\right] \\
& \mathrm{r}_{5}=\frac{1}{\kappa_{1}}\left[\mathrm{~F}_{4}+\mathrm{F}_{5}\left(\kappa_{1}+\mathrm{b}\right)+\mathrm{F}_{6} \kappa_{1} \mathrm{~b}\right], \quad \mathrm{r}_{4}=\frac{1}{\kappa_{1}}\left[\mathrm{~F}_{2}+\mathrm{F}_{4}\left(\kappa_{1}+\mathrm{b}\right)+\mathrm{F}_{5} \kappa_{1} \mathrm{~b}\right] \\
& \mathrm{r}_{3}=\frac{1}{\kappa_{1}}\left[\mathrm{~F}_{3}+\mathrm{F}_{2}\left(\kappa_{1}+\mathrm{b}\right)+\mathrm{F}_{4} \kappa_{1} \mathrm{~b}\right], \quad \mathrm{r}_{2}=\frac{1}{\kappa_{1}}\left[\mathrm{~F}_{1}+\mathrm{F}_{3}\left(\kappa_{1}+\mathrm{b}\right)+\mathrm{F}_{2} \kappa_{1} \mathrm{~b}\right] \\
& \mathrm{r}_{1}=\frac{1}{\kappa_{1}}\left[\mathrm{~F}_{1}\left(\kappa_{1}+\mathrm{b}\right)+\mathrm{F}_{3} \kappa_{1} \mathrm{~b}\right], \quad \mathrm{r}_{0}=\mathrm{F}_{1} \mathrm{~b}
\end{aligned}
$$

We now need to verify that all the coefficients $r_{0}, r_{1}, r_{2}, r_{3}, r_{4}, r_{5}$ and $r_{6}$ are positive. For this, it is sufficient to prove that $\mathrm{F}_{1}, \mathrm{~F}_{2}, \mathrm{~F}_{3}, \mathrm{~F}_{4}, \mathrm{~F}_{5}$ and $\mathrm{F}_{6}$ are positive. We can clearly see that all the $F_{j}, j=1$ to 6 , are positive when $R_{0}<1$. Therefore, all the $r_{j}, j=1$ to 6 , are positive when $\mathrm{R}_{0}<1$. Therefore, from Routh Hurwitz Criterion, $\mathrm{E}_{0}$ is locally asymptotically stable if $R_{0}<1$.

## 6. Global Stability

In Theorem 2, we have proved that the disease-free equilibrium point $\mathrm{E}_{0}$ is locally asymptotically stable if $\mathrm{R}_{0}<1$. We will now prove that, independently of the initial population size, if $\mathrm{R}_{0}<1$, then the disease will die out. Let us define:

$$
\mathrm{x}_{1}=\frac{\mathrm{b}}{\kappa_{1}}-\mathrm{s}_{1} \quad \text { and } \quad \mathrm{x}_{2}=\frac{\gamma}{\kappa_{2}}-\mathrm{s}_{2} .
$$

The system (5) becomes:
$\mathrm{E}_{0}\left(\frac{\mathrm{~b}}{\kappa_{1}}, 0,0,0, \frac{\gamma}{\kappa_{1}}, 0,0,0\right)$ is globally asymptotically stable for system (5) if and only if $\mathrm{E}_{0}(0,0,0,0,0,0,0,0)$ is globally asymptotically stable for system (20) .

## Theorem 3.

If $\mathrm{R}_{0}<1$, then the disease-free equilibrium point $\mathrm{E}_{0}(0,0,0,0,0,0,0,0)$ is globally asymptotically stable for the system (20).

Proof. Consider the following function $\mathrm{V}: \Gamma \longrightarrow \mathbb{R}_{+}$defined by:
$V=\kappa_{2}^{-1}\left[\left(\mathrm{M}_{7}-\gamma \mathrm{M}_{4}\right) \mathrm{i}_{1}^{1}+\mathrm{b}\left(\mathrm{M}_{2} \mathrm{i}_{1}^{2}+\mathrm{M}_{4} \mathrm{i}_{2}^{1}+\mathrm{M}_{5} \mathrm{i}_{2}^{2}+\left(\mathrm{M}_{3}+\mathrm{M}_{6}\right)\left(\sum_{\mathrm{j}=1}^{2} \mathrm{x}_{\mathrm{j}}-\sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}-\sum_{\mathrm{j}=1}^{2} \mathrm{i}_{2}^{\mathrm{j}}\right)\right)\right]$

If $\mathrm{R}_{0}<1$, then $\mathrm{M}_{7}-\gamma \mathrm{M}_{4}, \mathrm{M}_{2}, \mathrm{M}_{3}, \mathrm{M}_{4}, \mathrm{M}_{5}$ and $\mathrm{M}_{6}$ are positive. Consequently, the function V is positive and vanishes at the disease-free equilibrium. The derivative of this Lyapunov function $V$ along the trajectories of the ordinary differential system is

$$
\begin{aligned}
\dot{V} & =\kappa_{2}^{-1}\left(\mathrm{M}_{7}-\kappa \gamma \mathrm{M}_{4}\right)\left[\left(\mathrm{b} \kappa_{1}^{-1}-\mathrm{x}_{1}\right)\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right)-\kappa_{2} \mathrm{i}_{1}^{1}\right]+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{2}\left(\mathrm{a}_{1} \mathrm{i}_{1}^{1}-\kappa_{3} \mathrm{i}_{1}^{2}\right) \\
& +\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{3}\left(\mathrm{a}_{2} \mathrm{i}_{1}^{2}-\kappa_{4} \mathrm{i}_{1}^{3}\right)+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{4}\left[\left(\gamma \kappa_{1}^{-1}-\mathrm{x}_{2}\right)\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right)-\kappa_{5} \mathrm{i}_{2}^{1}+\mathrm{c}_{1} 1_{1}^{1}\right] \\
& +\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{5}\left(\mathrm{a}_{3} \mathrm{i}_{2}^{1}-\kappa_{6} \mathrm{i}_{2}^{2}+\mathrm{c}_{2} \mathrm{i}_{1}^{2}\right)+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{6}\left(\mathrm{a}_{4} \mathrm{i}_{2}^{2}-\mathrm{bi} 1_{2}^{3}+\mathrm{c}_{3} \mathrm{i}_{1}^{3}\right) .
\end{aligned}
$$

We can also write

$$
\begin{aligned}
\dot{V}= & \kappa_{2}^{-1}\left(\mathrm{M}_{7}-\gamma \mathrm{M}_{4}\right) \frac{b}{\kappa_{1}}\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right)-\kappa_{2}^{-1}\left(\mathrm{M}_{7}-\gamma \mathrm{M}_{4}\right)\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right) \mathrm{x}_{1} \\
& -\left(\mathrm{M}_{7}-\gamma \mathrm{M}_{4}\right) \mathrm{i}_{1}^{1}+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{2} \mathrm{a}_{1} \mathrm{i}_{1}^{1}-\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{2} \kappa_{3} \mathrm{i}_{1}^{2}+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{3} \mathrm{a}_{2} \mathrm{i}_{1}^{2}-\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{3} \kappa_{4} \mathrm{i}_{1}^{3}-\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{4} \kappa_{5} \mathrm{i}_{2}^{1} \\
& +\mathrm{b} \kappa_{2}^{-1} \gamma \mathrm{M}_{4} \kappa_{1}^{-1}\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right)-\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{4}\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right) \mathrm{x}_{2}+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{4} \mathrm{c}_{1} \mathrm{i}_{1}^{1} \\
& +\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{5} \mathrm{a}_{3} \mathrm{i}_{2}^{1}-\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{5} \kappa_{6} \mathrm{i}_{2}^{2}+b \kappa_{2}^{-1} \mathrm{M}_{5} \mathrm{c}_{2} \mathrm{i}_{1}^{2}+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{6} \mathrm{a}_{4}^{2}{ }_{2}^{2}-\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{6} \mathrm{bi}_{2}^{3}+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{6} \gamma_{3} \mathrm{i}_{2}^{3} .
\end{aligned}
$$

Following algebraic manipulations, it holds:

$$
\begin{aligned}
\dot{V}= & -\kappa_{2}^{-1}\left(\mathrm{M}_{7}-\gamma \mathrm{M}_{4}\right)\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right) \mathrm{x}_{1}-\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{4}\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right) \mathrm{x}_{2} \\
& +\left(-\mathrm{M}_{7}+\gamma \mathrm{M}_{4}+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{2} \mathrm{a}_{1}+\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{4} \mathrm{c}_{1}+\beta_{1} \mathrm{~b} \kappa_{1}^{-1} \kappa_{2}^{-1} \mathrm{M}_{7}\right) \mathrm{i}_{1}^{1}
\end{aligned}
$$

or
$\dot{V}=-\kappa_{2}^{-1}\left(\mathrm{M}_{7}-\gamma \mathrm{M}_{4}\right)\left(\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}\right) \mathrm{x}_{1}-\mathrm{b} \kappa_{2}^{-1} \mathrm{M}_{4}\left(k_{h}+k_{f}\right) \mathrm{x}_{2}-\left(\mathrm{M}_{7}-\gamma \mathrm{M}_{4}-\mathrm{bM}_{1}\right) \mathrm{i}_{1}^{1}$.
If $R_{0}<1$, then $\mathrm{M}_{7}-\kappa \theta \mathrm{M}_{4}$ and $\mathrm{M}_{7}-\kappa \theta \mathrm{M}_{4}-b \mathrm{M}_{1}$ are positive, consequently, $\dot{V}$ is negative definite along the trajectories of the system (5). Therefore, the DFE $\mathrm{E}_{0}$ is globally asymptotically stable for the system (5) if $\mathrm{R}_{0}<1$.

This ends the proof of Theorem 3.

## 7. Existence of Endemic Equilibrium

In this section, we analyze the existence of non-trivial endemic equilibrium $\mathrm{E}^{*}\left(\mathrm{~s}_{1}^{*}, \mathrm{i}_{1}^{1^{*}}, \mathrm{i}_{1}^{2^{*}}, \mathrm{i}_{1}^{3^{*}}, \mathrm{~s}_{2}^{*}, \mathrm{i}_{2}^{1^{*}}, \mathrm{i}_{2}^{2^{*}}, \mathrm{i}_{2}^{3 *}\right)$ of the system (5).

## Theorem 4.

If $\mathrm{R}_{0}>1$, then there exists an endemic equilibrium point $\mathrm{E}^{*}$ for the system (5).
Proof. Solving the equations of system (5) at equilibrium state, we obtain:

$$
\begin{align*}
\mathrm{s}_{1} & =\frac{\kappa_{2} \mathrm{i}_{1}^{1}}{\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}}  \tag{21a}\\
\mathrm{~s}_{2} & =\frac{\kappa_{5} \mathrm{i}_{2}^{1}-\mathrm{c}_{1} \mathrm{i}_{1}^{1}}{\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}}}  \tag{21b}\\
\mathrm{i}_{1}^{2} & =\frac{\mathrm{a}_{1}}{\kappa_{3}} \mathrm{i}_{1}^{1}  \tag{21c}\\
\mathrm{i}_{1}^{3} & =\frac{\mathrm{a}_{1} \mathrm{a}_{2}}{\kappa_{3} \kappa_{4}} \mathrm{i}_{1}^{1}  \tag{21d}\\
\mathrm{i}_{2}^{2} & =\frac{\mathrm{a}_{3}}{\kappa_{6}} \mathrm{i}_{2}^{1}+\frac{\mathrm{a}_{1} \mathrm{c}_{2}}{\kappa_{6} \kappa_{3}} \mathrm{i}_{1}^{1}  \tag{21e}\\
\mathrm{i}_{2}^{3} & =\frac{\mathrm{a}_{3} \mathrm{a}_{4}}{\mathrm{~b} \kappa_{6}} \mathrm{i}_{2}^{1}+\left(\frac{\mathrm{a}_{4} \mathrm{a}_{1} \mathrm{c}_{2}}{\mathrm{~b} \kappa_{6} \kappa_{3}}+\frac{\mathrm{a}_{1} \mathrm{a}_{2} \mathrm{c}_{3}}{\mathrm{~b} \kappa_{4} \kappa_{3}}\right) \mathrm{i}_{1}^{1}  \tag{21f}\\
\mathrm{i}_{2}^{1} & =-\mathrm{i}_{1}^{1} \frac{\mathrm{f}_{38}+\mathrm{f}_{39} \mathrm{i}_{1}^{1}}{\beta_{2} \kappa_{3} \kappa_{4}\left(-\mathrm{f}_{40}+\mathrm{f}_{41} \mathrm{i}_{1}^{1}\right)}  \tag{21~g}\\
\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}} & =\frac{\mathrm{b}-\kappa_{1} \mathrm{~s}_{1}}{\mathrm{~s}_{1}} \tag{21h}
\end{align*}
$$

where

$$
\begin{aligned}
\mathrm{f}_{38}= & -\beta_{1} \kappa_{6} \mathrm{~b}^{2} \kappa_{4} \kappa_{3}-\beta_{1} \kappa_{6} \mathrm{~b}^{2} \mathrm{a}_{1} \kappa_{4}-\beta_{1} \kappa_{6} \mathrm{~b}^{2} \mathrm{a}_{1} \mathrm{a}_{2}-\beta_{2} \mathrm{a}_{1} \mathrm{c}_{2} \mathrm{~b}^{2} \kappa_{4}-\mathrm{b} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{4} \mathrm{c}_{2} \kappa_{4}-\mathrm{b} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{2} \mathrm{c}_{3} \kappa_{6} \\
& +\kappa_{1} \kappa_{2} \kappa_{6} \kappa_{3} \mathrm{~b} \kappa_{4} \\
\mathrm{f}_{39}= & \kappa_{2} \beta_{1} \kappa_{6} \mathrm{~b} \kappa_{4} \kappa_{3}+\kappa_{2} \beta_{1} \kappa_{6} \mathrm{ba}_{1} \kappa_{4}+\kappa_{2} \beta_{1} \kappa_{6} \mathrm{ba}_{1} \mathrm{a}_{2}+\kappa_{2} \beta_{2} \mathrm{a}_{1} \mathrm{c}_{2} \mathrm{~b} \kappa_{4}+\kappa_{2} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{4} \mathrm{c}_{2} \kappa_{4}+\kappa_{2} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{2} \mathrm{c}_{3} \kappa_{6} \\
\mathrm{f}_{40}= & \mathrm{b}^{2} \kappa_{6}+\mathrm{a}_{3} \mathrm{~b}^{2}+\mathrm{ba}_{3} \mathrm{a}_{4} \\
\mathrm{f}_{41}= & \kappa_{2} \mathrm{~b} \kappa_{6}+\kappa_{2} \mathrm{a}_{3} \mathrm{~b}+\kappa_{2} \mathrm{a}_{3} \mathrm{a}_{4} .
\end{aligned}
$$

From (21b)-(21g), let

$$
\begin{equation*}
\mathrm{f}_{44}\left(\mathrm{i}_{1}^{1}\right)^{2}+\mathrm{f}_{43} \mathrm{i}_{1}^{1}+\mathrm{f}_{42}=0 \tag{22}
\end{equation*}
$$

where

$$
\begin{aligned}
\mathrm{f}_{42}= & \mathrm{b}^{2}\left(1-\mathrm{R}_{0}\right) \mathrm{b} \kappa_{1} \kappa_{2} \kappa_{3} \kappa_{4} \kappa_{5} \kappa_{6} \\
\mathrm{f}_{43}= & \kappa_{2} \mathrm{~b}\left(2 \mathrm{~b}^{2} \kappa_{6} \kappa_{5} \beta_{1} \mathrm{a}_{1} \kappa_{4}+2 \mathrm{~b}^{2} \kappa_{6} \kappa_{5} \beta_{1} \mathrm{a}_{1} \mathrm{a}_{2}+2 \mathrm{~b}^{2} \kappa_{6} \kappa_{5} \beta_{1} \kappa_{4} \kappa_{3}+2 \mathrm{~b}^{2} \kappa_{6} \beta_{2} \kappa_{3} \kappa_{4} \mathrm{c}_{1}+2 \mathrm{~b}^{2} \kappa_{5} \beta_{2} \mathrm{a}_{1} \mathrm{c}_{2} \kappa_{4}\right. \\
& +2 \mathrm{~b}^{2} \beta_{2} \kappa_{3} \kappa_{4} \mathrm{c}_{1} \mathrm{a}_{3}+2 \mathrm{~b} \beta_{2} \kappa_{3} \kappa_{4} \mathrm{c}_{1} \mathrm{a}_{3} \mathrm{a}_{4}+2 \mathrm{~b} \kappa_{6} \kappa_{5} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{2} \mathrm{c}_{3}-\mathrm{b} \kappa_{6} \mathrm{c}_{1} \beta_{2} \kappa_{3} \kappa_{4} \kappa_{1}-\mathrm{bc}_{1} \beta_{2} \kappa_{3} \kappa_{4} \kappa_{1} \mathrm{a}_{3}
\end{aligned}
$$

$$
\begin{aligned}
& -\mathrm{b} \kappa_{6} \kappa_{5} \kappa_{1} \beta_{1} \kappa_{4} \kappa_{3}+2 \mathrm{~b} \kappa_{2} \beta_{2} \kappa_{3} \kappa_{4} \gamma \mathrm{a}_{3}-\mathrm{b} \kappa_{6} \kappa_{5} \kappa_{1} \beta_{1} \mathrm{a}_{1} \kappa_{4}-\mathrm{b} \kappa_{6} \kappa_{5} \kappa_{1} \beta_{1} \mathrm{a}_{1} \mathrm{a}_{2}-\mathrm{b} \kappa_{2} \kappa_{6} \kappa_{5} \kappa_{1} \kappa_{3} \kappa_{4} \\
& +2 \mathrm{~b} \kappa_{5} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{4} \mathrm{c}_{2} \kappa_{4}-\mathrm{b} \kappa_{5} \kappa_{1} \beta_{2} \mathrm{a}_{1} \mathrm{c}_{2} \kappa_{4}+2 \mathrm{~b} \kappa_{2} \kappa_{6} \beta_{2} \kappa_{3} \kappa_{4} \gamma-\kappa_{6} \kappa_{5} \kappa_{1} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{2} \mathrm{c}_{3}+2 \kappa_{2} \beta_{2} \kappa_{3} \kappa_{4} \mathrm{a}_{3} \mathrm{a}_{4} \\
& \left.+\kappa_{2} \kappa_{6} \kappa_{5} \kappa_{1}^{2} \kappa_{3} \kappa_{4}-\mathrm{c}_{1} \beta_{2} \kappa_{3} \kappa_{4} \kappa_{1} \mathrm{a}_{3} \mathrm{a}_{4}-\kappa_{5} \kappa_{1} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{4} \mathrm{c}_{2} \kappa_{4}\right) \\
\mathrm{f}_{44}= & \kappa_{2}^{2}\left(-\kappa_{2} \beta_{2} \kappa_{3} \kappa_{4} \gamma \mathrm{a}_{3} \mathrm{a}_{4}-\mathrm{b} \kappa_{2} \kappa_{6} \beta_{2} \kappa_{3} \kappa_{4} \gamma-b \kappa_{2} \beta_{2} \kappa_{3} \kappa_{4} \gamma \mathrm{a}_{3}+\mathrm{b} \kappa_{6} \mathrm{c}_{1} \beta_{2} \kappa_{3} \kappa_{4} \kappa_{1}+\mathrm{bc} \mathrm{c}_{1} \beta_{2} \kappa_{3} \kappa_{4} \kappa_{1} \mathrm{a}_{3}\right. \\
& +\mathrm{c}_{1} \beta_{2} \kappa_{3} \kappa_{4} \kappa_{1} a_{3} \mathrm{a}_{4}-\mathrm{b}^{2} \kappa_{6} \kappa_{5} \beta_{1} \kappa_{4} \kappa_{3}-\mathrm{b}^{2} \kappa_{6} \kappa_{5} \beta_{1} \mathrm{a}_{1} \mathrm{a}_{2}+\mathrm{b} \kappa_{6} \kappa_{5} \kappa_{1} \beta_{1} \mathrm{a}_{1} \kappa_{4}+\kappa_{6} \kappa_{5} \kappa_{1} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{2} \mathrm{c}_{3} \\
& -\mathrm{b}^{2} \kappa_{6} \kappa_{5} \beta_{1} \mathrm{a}_{1} \kappa_{4}+\mathrm{b} \kappa_{6} \kappa_{5} \kappa_{1} \beta_{1} \mathrm{a}_{1} \mathrm{a}_{2}+\kappa_{5} \kappa_{1} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{4} \mathrm{c}_{2} \kappa_{4}-\mathrm{b}^{2} \beta_{2} \kappa_{3} \kappa_{4} \mathrm{c}_{1} \mathrm{a}_{3}+\mathrm{b} \kappa_{6} \kappa_{5} \kappa_{1} \beta_{1} \kappa_{4} \kappa_{3} \\
& -b \beta_{2} \kappa_{3} \kappa_{4} \mathrm{c}_{1} \mathrm{a}_{3} \mathrm{a}_{4}-\mathrm{b}^{2} \kappa_{6} \beta_{2} \kappa_{3} \kappa_{4} \mathrm{c}_{1}-\mathrm{b}^{2} \kappa_{5} \beta_{2} \mathrm{a}_{1} \mathrm{c}_{2} \kappa_{4}-\mathrm{b} \kappa_{6} \kappa_{5} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{2} \mathrm{c}_{3}-\mathrm{b} \kappa_{5} \beta_{2} \mathrm{a}_{1} \mathrm{a}_{4} \mathrm{c}_{2} \kappa_{4} \\
& \left.+\mathrm{b} \kappa_{5} \kappa_{1} \beta_{2} \mathrm{a}_{1} \mathrm{c}_{2} \kappa_{4}\right) .
\end{aligned}
$$

By replacing $\kappa_{1}, \kappa_{2}, \kappa_{3}, \kappa_{4}, \kappa_{5}$ and $\kappa_{6}$ by their expressions into $\mathrm{f}_{44}$, we get:

$$
\begin{aligned}
\mathrm{f}_{44}=\left(\mathrm{a}_{1}+\mathrm{c}_{1}+\mathrm{b}\right)^{2} \mathrm{~b} \gamma\left(-\beta_{2}+\beta_{1}\right)\left(\mathrm{b}+\mathrm{a}_{4}\right)\left(\mathrm{b}+\mathrm{a}_{3}\right)(\quad & \mathrm{b}^{2}+\mathrm{ba}_{2}+b c_{2} \\
& \left.+\mathrm{bc}_{3}+\mathrm{a}_{1} \mathrm{~b}+\mathrm{a}_{1} \mathrm{c}_{3}+\mathrm{a}_{1} \mathrm{a}_{2}+\mathrm{c}_{2} \mathrm{c}_{3}+\mathrm{a}_{2} \mathrm{c}_{3}\right)
\end{aligned}
$$

If $\mathrm{R}_{0}>1$, we clearly see that $\mathrm{f}_{42}<0$. We also note that:
(i) If $\beta_{1}>\beta_{2}$, then $\mathrm{f}_{44}>0$. Consequently, the discriminant of (22) is positive and the product of the solutions is negative. So, there exists a positive solution $i_{1}^{1}$ for (22).
(ii) If $\beta_{1}<\beta_{2}$, then $\mathrm{f}_{44}<0$ and $\mathrm{f}_{43}>0$. Consequently, the discriminant of (22) is positive, the sum and the product of the solutions of (22) are positive. Therefore, there exist two distinct solutions.
(iii) If $\beta_{1}=\beta_{2}$, then $\mathrm{f}_{44}=0$ and $\mathrm{f}_{43}>0$. So, (22) becomes:

$$
\begin{equation*}
\mathrm{f}_{43} 1_{1}^{1}+\mathrm{f}_{42}=0 . \tag{23}
\end{equation*}
$$

Therefore, there exists a unique positive solution $\mathrm{i}_{1}^{1}$.
In all the cases discussed above, there exists at least a positive solution $\mathrm{i}_{1}^{1}$ of (22). Let us denote by $i_{1}^{1^{*}}$ this positive solution. We will now define and prove the positivity of $i_{2}^{1^{*}}$, $\mathrm{i}_{1}^{3^{*}}, \mathrm{i}_{2}^{2^{*}}, \mathrm{i}_{2}^{3 *}, \mathrm{~s}_{1}{ }^{*}$ and $\mathrm{s}_{2}{ }^{*}$ if $\mathrm{R}_{0}>1$.

From equation (21g), we get:

If $R_{0}>1$, then $f_{38}>0$. From (21a) and (21h), it follows that $-f_{40}+f_{41} 1_{1}{ }_{1}^{*}<0$, hence $\mathrm{i}_{2}^{1^{*}}>0$.

From equation (21c), it follows that $\mathrm{i}_{1}^{2^{*}}=\frac{a_{1}}{\kappa_{3}} \mathrm{i}_{1}^{1^{*}}$, hence $\mathrm{i}_{1}^{2^{*}}>0$.

From equation (21d), it follows that, $\mathrm{i}_{1}^{3^{*}}=\frac{\mathrm{a}_{1} \mathrm{a}_{2}}{\kappa_{3} \kappa_{4}} \mathrm{i}_{1}{ }^{*}$, hence $\mathrm{i}_{1}^{3^{*}}>0$.
From equation (21e), it follows that, $\mathrm{i}_{2}^{2^{*}}=\frac{\mathrm{a}_{3}}{\kappa_{6}} \mathrm{i}_{2}^{1^{*}}+\frac{\mathrm{a}_{1} \mathrm{c}_{2}}{\kappa_{6} \kappa_{3}} \mathrm{i}_{1}{ }^{*}$, hence $\mathrm{i}_{2}^{2^{*}}>0$.
From equation (21f), it follows that, $i_{2}^{3^{*}}=\frac{a_{3} a_{4}}{b \kappa_{6}} i_{2}^{*}+\left(\frac{a_{4} a_{1} c_{2}}{b \kappa_{6} \kappa_{3}}+\frac{a_{1} a_{2} c_{3}}{b \kappa_{4} \kappa_{3}}\right) i_{1}^{1^{*}}$, hence $\mathrm{i}_{2}^{3^{*}}>0$.

From equation (21a), it follows that, $\mathrm{s}_{1}^{*}=\frac{\kappa_{2} 1_{1}{ }^{*}}{\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}{ }^{*}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}^{*}}}$, hence $\mathrm{s}_{1}^{*}>0$.
From equation (21b), it follows that, $\mathrm{s}_{2}^{*}=\frac{\kappa_{5} \mathrm{i}_{2}^{*}-\mathrm{c}_{1} 1_{1}^{1^{*}}}{3}$, hence $\mathrm{s}_{2}^{*}>0$.

$$
\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}^{\mathrm{j}_{1}^{*}}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}^{\mathrm{j}},
$$

Therefore, if $R_{0}>1$, there exists a positive solution $E^{*}\left(s_{1}^{*}, i_{1}^{1^{*}}, i_{1}^{2^{*}}, i_{1}^{3^{*}}, s_{2}^{*}, i_{2}^{1^{*}}, i_{2}^{2^{*}}, i_{2}^{3^{*}}\right)$ for the system (5).

## 8. Stability Analysis of Endemic Equilibrium

## Theorem 5.

If $\mathrm{R}_{0}>1$, then the endemic equilibrium point

$$
\mathrm{E}^{*}\left(\mathrm{~s}_{1}^{*}, \mathrm{i}_{1}^{1^{*}}, \mathrm{i}_{1}^{2^{*}}, \mathrm{i}_{1}^{3^{*}}, \mathrm{~s}_{2}^{*}, \mathrm{i}_{2}^{1^{*}}, \mathrm{i}_{2}^{2^{*}}, \mathrm{i}_{2}^{3^{*}}\right)
$$

is locally asymptotically stable.
Proof. Let us compute the jacobian of the system at the point $\mathrm{E}^{*}\left(\mathrm{~s}_{1}^{*}, \mathrm{i}_{1}^{*}, \mathrm{i}_{1}^{2^{*}}, \mathrm{i}_{1}^{3^{*}}, \mathrm{~s}_{2}^{*}, \mathrm{i}_{2}^{*}, \mathrm{i}_{2}^{2^{*}}, \mathrm{i}_{2}^{3^{*}}\right)$.

$$
J\left(\mathrm{E}^{*}\right)=\left(\begin{array}{cccccccc}
-\mathrm{H}^{*}-\kappa_{1} & -\beta_{1} \mathrm{~s}_{1}^{*} & -\beta_{1} \mathrm{~s}_{1}^{*} & -\beta_{1} \mathrm{~s}_{1}^{*} & 0 & -\beta_{2} \mathrm{~s}_{1}^{*} & -\beta_{2} \mathrm{~s}_{1}^{*} & -\beta_{2} \mathrm{~s}_{1}^{*} \\
\mathrm{H}^{*} & \beta_{1} \mathrm{~s}_{1}^{*}-\kappa_{2} & \beta_{1} \mathrm{~s}_{1}^{*} & \beta_{1} \mathrm{~s}_{1}^{*} & 0 & \beta_{2} \mathrm{~s}_{1}^{*} & \beta_{2} \mathrm{~s}_{1}^{*} & \beta_{2} \mathrm{~s}_{1}^{*} \\
0 & \mathrm{a}_{1} & -\kappa_{3} & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & \mathrm{a}_{2} & -\kappa_{4} & 0 & 0 & 0 & 0 \\
\gamma & -\beta_{1} \mathrm{~s}_{2}^{*} & -\beta_{1} \mathrm{~s}_{2}^{*} & -\beta_{1} \mathrm{~s}_{2}^{*} & -\mathrm{H}^{*}-\mathrm{b} & -\beta_{2} \mathrm{~s}_{2}^{*} & -\beta_{2} \mathrm{~s}_{2}^{*} & -\beta_{2} \mathrm{~s}_{2}^{*} \\
0 & \beta_{1} \mathrm{~s}_{2}^{*}+\mathrm{c}_{1} & \beta_{1} \mathrm{~s}_{2}^{*} & \mathrm{H}^{*} & \beta_{2} \mathrm{~s}_{2}^{*}-\kappa_{5} & \beta_{2} \mathrm{~s}_{2}^{*} & \beta_{2} \mathrm{~s}_{2}^{*} & \\
0 & 0 & \mathrm{c}_{2} & 0 & 0 & \mathrm{a}_{3} & -\kappa_{6} & 0 \\
0 & 0 & 0 & \mathrm{c}_{3} & 0 & 0 & \mathrm{a}_{4} & -\mathrm{b}
\end{array}\right)
$$

where $\mathrm{H}^{*}=\beta_{1} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{1}{ }^{*}{ }^{*}+\beta_{2} \sum_{\mathrm{j}=1}^{3} \mathrm{i}_{2}{ }^{*}$.
The characteristic equation of $J\left(\mathrm{E}^{*}\right)$ is given by:

$$
\begin{equation*}
\mathrm{A}_{8} \mathrm{X}^{8}+\mathrm{A}_{7} \mathrm{X}^{7}+\mathrm{A}_{6} \mathrm{X}^{6}+\mathrm{A}_{5} \mathrm{X}^{5}+\mathrm{A}_{4} \mathrm{X}^{4}+\mathrm{A}_{3} \mathrm{X}^{2}+\mathrm{A}_{2} \mathrm{X}^{2}+\mathrm{A}_{1} \mathrm{X}+\mathrm{A}_{0}=0 \tag{24}
\end{equation*}
$$

where $\mathrm{A}_{0}, \mathrm{~A}_{1}, \mathrm{~A}_{2}, \mathrm{~A}_{3}, \mathrm{~A}_{4}, \mathrm{~A}_{5}, \mathrm{~A}_{6}, \mathrm{~A}_{7}, \mathrm{~A}_{8}$ are obtained as a result of a boring calculation. They are all positive. Applying the Routh-Hurwitz criterion [7], it follows that all eigenvalues of the characteristic equation (24) have negative real part if $\mathrm{R}_{0}>1$. Therefore, the endemic solution $E^{*}$ is locally asymptotically stable if $\mathrm{R}_{0}>1$.

## 9. Numerical Simulations and Discussion

In this section, we perform numerical simulations to support the theoretical results from the mathematical analysis of model (5). In addition to the verification of the theoretical results, these numerical solutions are very important from a practical point of view.

We first consider the case where $\mathrm{R}_{0}=0.67893<1$ using the parameter values reported in Table 4.

Using different initial conditions, the dynamics of the susceptible and infected populations of the model are plotted in Figures 2, 3, 4 and 5.

In Figure 2, we can observe that the proportions of susceptible individuals in classes $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$ are consistent, ( $\mathrm{s}_{1}=0.63343, \mathrm{~s}_{2}=0.36657$ ). In contrast, as shown in Figures 3,4 and 5 , the proportions of infected individuals in classes $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$ decline to zero ( $\mathrm{i}_{1}^{1}=0, \mathrm{i}_{1}^{2}=0, \mathrm{i}_{1}^{3}=0, \mathrm{i}_{2}^{1}=0, \mathrm{i}_{2}^{2}=0, \mathrm{i}_{2}^{3}=0$ ), i.e. approach the disease-free equilibrium

Table 4: Parameter values

| Parameter | Value | Source | Parameter | Value | Source |
| :---: | :---: | :---: | :---: | :---: | :---: |
| b | 0.0432 | Estimated | $\mathrm{a}_{2}$ | 0.01 | Estimated |
| m | 0.0096 | Estimated | $\mathrm{a}_{3}$ | 0.01 | Estimated |

(DFE). They show that DFE is locally asymptotically stable when $\mathrm{R}_{0}<1$. These numerical simulations support the result stated in Theorem 2 on the stability of DFE.

Further using the parameter values given in Table 5 , we consider the case when $\mathrm{R}_{0}=$

Using different initial conditions, the dynamics of the susceptible and infected popu-
lations of the model are plotted in Figures 6, 7, 8 and 9.

Figure 6: Time series plot of the proportions of susceptible individuals in classes $C_{1}$ and $C_{2}$ for $R_{0}=1.408>1$ using various initial conditions and parameter values reported in Table 5.

Figure 7: Time series plot of the proportions of individuals infected at stage 1 in classes $C_{1}$ and $C_{2}$ for $\mathrm{R}_{0}=1.408>1$ using various initial conditions and parameter values reported in Table 5.

As shown in Figures 6, 7, 8 and 9, the proportions of susceptible and infected individuals in classes $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$ are consistent, $\left[\left(\mathrm{s}_{1}{ }^{*}, \mathrm{i}_{1}^{1^{*}}, \mathrm{i}_{1}^{2^{*}}, \mathrm{i}_{1}^{3^{*}}, \mathrm{~s}_{2}{ }^{*}, \mathrm{i}_{2}^{*}, \mathrm{i}_{2}^{2}, \mathrm{i}_{2}^{3^{*}}\right)=\right.$ ( $0.49548,0.12853,0.017559,0.0027783,0.19918,0.11941,0.029047,0.0080157$ )], i.e., the population tends to endemic equilibrium $\mathrm{E}^{*}$ when $\mathrm{R}_{0}>1$. This indicates that, regardless of initial conditions, the infected population eventually reaches endemic equilibrium over time and the disease-free equilibrium point becomes unstable when $\mathrm{R}_{0}>1$. These numerical simulations support our theoretical results.

## 10. Conclusions

In this paper, we have developed a mathematical model for the spread of HIV disease within two different age classes. We proposed a basic reproduction number that depends

Figure 8: Time series plot of the proportions of individuals infected at stage 2 in classes $C_{1}$ and $C_{2}$ for $\mathrm{R}_{0}=1.408>1$ using various initial conditions and parameter values reported in Table 5.

on the characteristics of the two age classes. We have proved that if the Routh-Hurwitz criterion are satisfied, then the disease-free equilibrium (DFE) $\mathrm{E}_{0}$ is locally asymptotically stable. We constructed a Lyapunov function to prove that the disease-free equilibrium (DFE) $\mathrm{E}_{0}$ is globally stable when $\mathrm{R}_{0}<1$. For $\mathrm{R}_{0}>1$, we obtain from mathematical analysis a quadratic equation in $\mathrm{i}_{1}^{1}$. It has been proven that the existence of an endemic equilibrium depends on the existence of at least one real positive value for $\mathrm{i}_{1}^{1}$. The stability analysis of endemic equilibrium produces that if the Routh-Hurwitz criterion are satisfied, then the endemic equilibrium $\mathrm{E}^{*}$ is locally asymptotically stable. The important mathematical results in this paper were all corroborated by numerical simulations performed using MATLAB. Indeed, we verified through numerical experiments that the disease-free equilibrium $\mathrm{E}_{0}$ is stable when $\mathrm{R}_{0}<1$. On the other hand, we numerically verified that, if $\mathrm{R}_{0}>1$, then the endemic equilibrium $\mathrm{E}^{*}$ becomes stable.
