**Abstract.** In this paper, we study a special set in an implicative n.p.o. (negatively partially ordered) ternary semigroup, and prove that a filter can be represented by the union of such sets. Indeed, let  $(T, [ \ ], \leq, [ \ ]^*)$  be an implicative n.p.o. ternary semigroup. For any  $a, b \in T$ , we define

$$S(a, b) := \{c \in T : [aa[bbc]^*]^* = 1\}.$$

We have the following:

- (1) A non-empty subset  $F$  of  $T$  is a filter if and only if it satisfies the following conditions:
  - (F3)  $1 \in F$ ;
  - (F4) for any  $a, b, c \in T$ , if  $[abc]^* \in F$  and  $a, b \in F$ , then  $c \in F$ .
- (2) If  $T$  is commutative and  $F$  is a filter of  $T$ , then

$$F = \bigcup_{a, b \in F} S(a, b).$$

**2020 Mathematics Subject Classifications:** 20M12, 06F99, 06A06, 06A12

**Key Words and Phrases:** Implicative negatively partially ordered ternary semigroup (INPOTS), filter, left self-distributive

### 1. Introduction

Implicative negatively partially ordered semigroups and filters were introduced and studied in [3] by Chan and Shum. The implicative negatively partially ordered semigroup is a generalization of the implicative semilattice (cf. [2], [8]), it is closed to implications in mathematical logic (cf. [1], [4]). As demonstrated in [8], filters play a crucial role in implicative semilattice theory. Quotient structures of implicative negatively partially

ordered semigroups through filters were constructed in [3]. Additionally, in [6], filters within commutative implicative negatively partially ordered semigroups were examined. In [5], the author introduced a set in an implicative negatively partially ordered semigroup, and gave an equivalent condition of a filter. Moreover, it is obtained that a filter is the union of that special sets.

In this paper, we follow these concepts to derive a special set in an implicative negatively partially ordered ternary semigroup, and prove that a filter can be represented by the union of such sets. Also, some important results are investigated.

## 2. Preliminaries

We collect results obtained in negatively partially ordered ternary semigroups.

**Definition 1.** [7] A system  $(T, [ ], \leq)$  is called a NPOTS (negatively partially ordered ternary semigroup) if

- (1)  $(T, [ ]) is a ternary semigroup;$
- (2)  $a partially order \leq on T is compatible with [ ];$
- (3)  $\forall a, b, c \in T, [abc] \leq a, [abc] \leq b, [abc] \leq c.$

**Definition 2.** [7] A NPOTS  $(T, [ ], \leq)$  is called an INPOTS (implicative negatively partially ordered ternary semigroup) if there is an additional ternary multiplication  $[ ]^*$  on  $T$  such that for all  $a, b, c, u \in T$ ,

$$u \leq [cbc]^* \Leftrightarrow [uab] \leq c.$$

Here,  $[ ]^*$  is a ternary implication.

A multiplicative identity of a ternary semigroup  $(T, [ ]) is an element 1 of T satisfying the condition  $[1a1] = [11a] = [a11] = a$  for any  $a \in T$ .$

**Example 1.** Consider the INPOTS  $(T, [ ], \leq, [ ]^*) defined as follows:$

$[ ]$	1	a	0	$[ ]$	1	a	0	$[ ]$	1	a	0
11	1	0	0	aa	0	0	0	00	0	0	0
1a	0	0	0	a1	0	0	0	01	0	0	0
10	0	0	0	a0	0	0	0	0a	0	0	0
$[ ]^*$	1	a	0	$[ ]^*$	1	a	0	$[ ]^*$	1	a	0
11	1	a	a	aa	1	1	1	00	1	1	1
1a	1	1	1	a1	1	1	1	01	1	1	1
10	1	1	1	a0	1	1	1	0a	1	1	1

and

$$\leq = \{(0, 0), (1, 1), (a, a), (a, 1), (0, a), (0, 1)\}.$$

We place  $x_1x_2$  in the first column and  $x_3$  in the first row to express the calculation  $[x_1x_2x_3]$  using a multiplication table. Observed that the greatest element 1 is not identity since  $[1a1] = 0 \neq a$ .

The following shows that not every NPOTS with identity admits the INPOTS.

**Example 2.** Let us consider a NPOTS  $(T, [ ], \leq)$  defined as follows:

[ ]		1	2	3	4	6
11		1	2	3	4	6
12		2	2	6	4	6
13		3	3	3	6	6
14		4	4	6	4	6
16		6	6	6	6	6

[ ]		1	2	3	4	6
21		2	2	6	4	6
22		2	2	6	4	6
23		6	6	6	6	6
24		4	4	6	4	6
26		6	6	6	6	6

  

[ ]		1	2	3	4	6
31		3	6	3	6	6
32		6	6	6	6	6
33		3	6	3	6	6
34		6	6	6	6	6
36		6	6	6	6	6

[ ]		1	2	3	4	6
41		4	4	6	4	6
42		4	4	6	4	6
43		6	6	6	6	6
44		4	4	6	4	6
46		6	6	6	6	6

  

[ ]		1	2	3	4	6
61		6	6	6	6	6
62		6	6	6	6	6
63		6	6	6	6	6
64		6	6	6	6	6
66		6	6	6	6	6

and

$$\leq = \{(1, 1), (2, 2), (3, 3), (4, 4), (6, 6), (3, 1), (2, 1), (4, a), (4, 1), (6, 4), (6, 2), (6, 3), (6, 1)\}.$$

The element 1 is the greatest element. Suppose  $T$  is an INPOTS with ternary implication  $[ ]^*$ . Clearly,  $[322] = 6 \leq 4$  and  $[422] = 2 \leq 2$ . Then  $3 \leq [224]^*$  and  $4 \leq [224]^*$ , so  $[224]^* = 1$ . As  $1 \leq [224]^*$ , we have  $2 = [122] \leq 4$ . This is a contradiction. Hence,  $T$  is not an INPOTS.

**Definition 3.** [9] An INPOTS  $(T, [ ], \leq, [ ]^*)$  is called commutative if

$$[a_1a_2a_3] = [a_{\alpha(1)}a_{\alpha(2)}a_{\alpha(3)}]$$

for any permutation  $\alpha \in S_3$ .

The example shows an infinite commutative INPOTS.

**Example 3.** [7] Let  $\mathbb{Z}^+$  be a TS such that  $[abc] = abc$  for all  $a, b, c \in \mathbb{Z}^+$ . Consider

$$\leq = \{(a, b) \in \mathbb{Z}^+ \times \mathbb{Z}^+ : b \mid a\}.$$

Here,  $b \mid a$  means  $b$  divides  $a$ . Then  $(\mathbb{Z}^+, [ ], \leq)$  is a commutative NPOTS;  $1$  is the greatest element. Define

$$[abc]^* = \frac{c}{\gcd(ab, c)}$$

for all  $a, b, c \in \mathbb{Z}^+$ . Then  $(\mathbb{Z}^+, [ ], \leq, [ ]^*)$  is a commutative INPOTS.

**Theorem 1.** [7] Let  $(T, [ ], \leq, [ ]^*)$  be an INPOTS. Then, for  $a, b \in T$ ,

- (1)  $a \leq [aaa]^*$ ;
- (2)  $[aaa]^* = [bbb]^*$ ;
- (3)  $[aaa]^*$  is the greatest element of  $T$ ; then an INPOTS always contains the greatest element.

Let  $1$  be the greatest element of a NPOTS  $(T, [ ], \leq)$  if exists. Assume  $1$  is the multiplicative identity. Then, for any  $u, v, w \in T$ ,  $[uvw] = 1 \Leftrightarrow u = 1, v = 1, w = 1$ .

Throughout this paper, we assume  $1$  is both the multiplicative identity and the greatest element of an INPOTS.

**Theorem 2.** [7] Let  $(T, [ ], \leq, [ ]^*)$  be an INPOTS. Then, for  $a, b, c, u, v \in T$ ,

- (1)  $a \leq 1, [aaa]^* = 1, a = [11a]^*$ ;
- (2)  $a \leq [bc[abc]]^*$ ;
- (3)  $a \leq [aa[aaa]]^*$ ;
- (4)  $a \leq [bca]^*$ ;
- (5) if  $a \leq b$ , then  $[buv]^* \leq [auv]^*$  and  $[uva]^* \leq [uvb]^*$ ;
- (6)  $a \leq b \Leftrightarrow [a1b]^* = 1 \Leftrightarrow [1ab]^* = 1$ ;
- (7)  $[ab[cuv]]^* = [[abc]uv]^* = [a[bcu]v]^*$ .

### 3. Filters of implicative negatively partially ordered ternary semigroups

We begin with filters of an INPOTS.

**Definition 4.** [7] Let  $(T, [ ], \leq, [ ]^*)$  be an INPOTS. Then  $\emptyset \neq F \subseteq T$  is called a filter of  $T$  if

(F1)  $[abc] \in F$  for any  $a, b, c \in F$ ;

(F2) for any  $x, y \in T$ ,  $a \leq b$  and  $a \in F$  imply  $b \in F$ .

**Proposition 1.** *Let  $(T, [ ], \leq, [ ]^*)$  be an INPOTS. Then  $\emptyset \neq F \subseteq T$  is a filter if and only if it holds the conditions:*

(F3)  $1 \in F$ ;

(F4) for any  $a, b, c \in T$ , if  $[abc]^* \in F$  and  $a, b \in F$ , then  $c \in F$ .

*Proof.* Assume that  $F$  is a filter of  $T$ . Since 1 is the greatest element of  $T$ ,  $1 \in F$ . It is observed that for any  $a, b, c \in T$ , from  $[abc]^* \leq [abc]^*$ , we have

$$[[abc]^*ab] \leq c. \tag{2.1}$$

Let  $a, b, c \in T$  be such that  $[abc]^* \in F$  and  $a, b \in F$ . By assumption, we have  $[[abc]^*ab] \in F$ . Using (2.1), we get  $[[abc]^*ab] \leq c$ . This implies that  $c \in F$ . Hence,  $F$  satisfies (F3) and (F4).

Conversely, assume that  $F$  satisfies (F3) and (F4). If  $a, b \in T$  such that  $a \leq b$  and  $a \in F$ , then by Theorem 2 (6) we have  $[1ab]^* = 1 \in F$ . By (F4),  $b \in F$ . Thus,  $F$  satisfies (F2). Let  $a, b, c \in F$ . By Theorem 2 (2),  $a \leq [bc[abc]]^*$ , and so by (F2) we get  $[bc[abc]]^* \in F$ . From (F4),  $[abc] \in F$ . Hence,  $F$  satisfies (F1). Consequently,  $F$  is a filter of  $T$ .

**Definition 5.** *Let  $(T, [ ], \leq, [ ]^*)$  be an INPOTS. For any  $a, b \in T$ , define*

$$S(a, b) := \{c \in T : [aa[bbc]^*]^* = 1\}.$$

Observe that  $1, b \in S(a, b)$  for any  $a, b \in T$ .

**Proposition 2.** *For a commutative INPOTS  $(T, [ ], \leq, [ ]^*)$ ,  $a \in S(a, b)$  for all  $a, b \in T$ .*

*Proof.* Let  $a, b \in T$ . By Theorem 2 (7),

$$\begin{aligned} [aa[bbba]^*]^* &= [a[abb]a]^* \\ &= [a[bba]a]^* \\ &= [ab[baa]^*]^* \\ &= [[abb]aa]^* \\ &= [[bba]aa]^* \\ &= [bb[aaa]^*]^* \\ &= [bb1]^*. \end{aligned}$$

From Theorem 2 (4),  $1 \leq [bb1]^* \leq 1$ . This implies that  $[aa[bbba]^*]^* = 1$ , and so  $a \in S(a, b)$ .

**Proposition 3.** *Let  $(T, [ \ ], \leq, [ \ ]^*)$  be an INPOTS, and  $b \in T$ . If  $[buv]^* = 1$  for all  $u, v \in T$ , then  $S(a, b) = T = S(b, a)$  for all  $a \in T$ .*

*Proof.* Assume that  $[buv]^* = 1$  for all  $u, v \in T$  and  $a \in T$ . Clearly,  $S(a, b) \subseteq T$  and  $S(b, a) \subseteq T$ . By assumption, we have  $[aa[bba]^*]^* = [aa1]^*$ . Since  $1 \leq [aa1]^* \leq 1$ , we have  $[aa[bba]^*]^* = 1$ , and then  $a \in S(a, b)$ . Thus,  $T \subseteq S(a, b)$ . By assumption,  $[bb[aaa]^*]^* = [bb1]^* = 1$ . This shows that  $a \in S(b, a)$ , and so  $T \subseteq S(b, a)$ .

**Example 4.** *Let us consider the INPOTS  $(T, [ \ ], \leq, [ \ ]^*)$  defined as follows:*

<table style="width: 100%; border-collapse: collapse;"> <thead> <tr><th style="border-right: 1px solid black; border-bottom: 1px solid black;">[ ]</th><th style="border-bottom: 1px solid black;">1</th><th style="border-bottom: 1px solid black;">2</th><th style="border-bottom: 1px solid black;">3</th><th style="border-bottom: 1px solid black;">4</th><th style="border-bottom: 1px solid black;">5</th><th style="border-bottom: 1px solid black;">7</th></tr> </thead> <tbody> <tr><td style="border-right: 1px solid black;">11</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">12</td><td>2</td><td>3</td><td>3</td><td>5</td><td>7</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">13</td><td>3</td><td>3</td><td>3</td><td>7</td><td>7</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">14</td><td>4</td><td>5</td><td>7</td><td>4</td><td>5</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">15</td><td>5</td><td>7</td><td>7</td><td>5</td><td>7</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">17</td><td>7</td><td>7</td><td>7</td><td>7</td><td>7</td><td>7</td></tr> </tbody> </table>	[ ]	1	2	3	4	5	7	11	1	2	3	4	5	7	12	2	3	3	5	7	7	13	3	3	3	7	7	7	14	4	5	7	4	5	7	15	5	7	7	5	7	7	17	7	7	7	7	7	7	<table style="width: 100%; border-collapse: collapse;"> <thead> <tr><th style="border-right: 1px solid black; border-bottom: 1px solid black;">[ ]</th><th style="border-bottom: 1px solid black;">1</th><th style="border-bottom: 1px solid black;">2</th><th style="border-bottom: 1px solid black;">3</th><th style="border-bottom: 1px solid black;">4</th><th style="border-bottom: 1px solid black;">5</th><th style="border-bottom: 1px solid black;">7</th></tr> </thead> <tbody> <tr><td style="border-right: 1px solid black;">21</td><td>2</td><td>3</td><td>3</td><td>5</td><td>7</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">22</td><td>3</td><td>3</td><td>3</td><td>7</td><td>7</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">23</td><td>3</td><td>3</td><td>3</td><td>7</td><td>7</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">24</td><td>5</td><td>7</td><td>7</td><td>5</td><td>7</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">25</td><td>7</td><td>7</td><td>7</td><td>7</td><td>7</td><td>7</td></tr> <tr><td style="border-right: 1px solid black;">27</td><td>7</td><td>7</td><td>7</td><td>7</td><td>7</td><td>7</td></tr> </tbody> </table>	[ ]	1	2	3	4	5	7	21	2	3	3	5	7	7	22	3	3	3	7	7	7	23	3	3	3	7	7	7	24	5	7	7	5	7	7	25	7	7	7	7	7	7	27	7	7	7	7	7	7

and

$$\leq = \{(1, 1), (2, 2), (3, 3), (4, 4), (5, 5), (7, 7), (3, 1), (3, 2), (2, 1), (4, 1), (5, 4), (5, 1), (5, 2)(7, 1), (7, 2), (7, 3), (7, 4), (7, 5)\}.$$

By Proposition 3, we have  $S(a, 7) = S(7, a) = T$  for all  $a \in T$ . Furthermore, we have  $S(1, 1) = \{1\}$ ,  $S(1, 2) = S(2, 1) = S(1, 3) = S(3, 1) = S(2, 3) = S(3, 2) = S(2, 2) = S(3, 3) = \{1, 2, 3\}$ ,  $S(1, 4) = S(4, 1) = S(4, 4) = \{1, 4\}$ , and  $S(2, 4) = S(4, 2) = S(3, 4) = S(4, 3) = S(1, 5) = S(2, 5) = S(3, 5) = S(4, 5) = S(5, 5) = S(5, 1) = S(5, 2) = S(5, 3) = S(5, 4) = T$ . We observe that for any  $a, b \in T$ ,  $S(a, b)$  is a filter of  $T$ .

**Theorem 3.** Let  $(T, [ \ ], \leq, [ \ ]^*)$  be a commutative INPOTS. If  $F$  is a filter, then  $S(a, b) \subseteq F$  for all  $a, b \in F$ .

*Proof.* Let  $F$  be a filter of  $T$  and let  $a, b \in F$ . If  $c \in S(a, b)$ , then  $[aa[bbc]^*]^* = 1 \in F$ , and by (F4) we have  $c \in F$ .

**Theorem 4.** Let  $(T, [ \ ], \leq, [ \ ]^*)$  be a commutative INPOTS. If  $F$  is a filter of  $T$ , then

$$F = \bigcup_{a,b \in F} S(a, b).$$

*Proof.* Let  $F$  be a filter of  $T$ . By Proposition 2,  $c \in S(c, 1)$  for any  $c \in F$ . Then

$$F \subseteq \bigcup_{c \in F} S(c, 1) \subseteq \bigcup_{a,b \in F} S(a, b).$$

For the reverse inclusion, let  $c' \in \bigcup_{a,b \in F} S(a, b)$ . Then there exist  $x, y \in F$  such that

$c' \in S(x, y)$ . By Theorem 3,  $c' \in F$ . This shows that  $\bigcup_{a,b \in F} S(a, b) \subseteq F$ .

**Corollary 1.** *Let  $(T, [ \ ], \leq, [ \ ]^*)$  be a commutative INPOTS. If  $F$  is a filter of  $T$ , then*

$$F = \bigcup_{a \in F} S(a, 1).$$

#### 4. Conclusions

In this paper, we introduce the concept of filters in implicative negatively partially ordered ternary semigroups (Definition 4) and give a characterization of filters (Proposition 1). Then we consider the set  $S(a, b) := \{c \in T : [aa[bbc]^*]^* = 1\}$  where  $a, b$  are elements of an implicative negatively partially ordered ternary semigroup  $(T, [ \ ], \leq, [ \ ]^*)$ . The main result obtained is that any filter can be represented by the union of such sets (Theorem 4), if  $(T, [ \ ], \leq, [ \ ]^*)$  is commutative.
